Clean Diesel (CDTI-NASDAQ)

CDTI: First quarter report.

First quarter revenues were in line with estimates but op. ex. still high. CDTi is working to add more partnerships in 2016.

Current Price (05/13/16)	$0.39
Valuation	**$2.00**

OUTLOOK

Clean Diesel Technologies is a leading provider of pollution control solutions for gasoline and diesel engines. The company offers both OEM and after-market products on a worldwide basis.

Over the next several years significant on highway diesel and gasoline vehicle pollution regulations will be implemented which will have a major impact on the company's revenue and earnings. Off highway markets are also significant and are becoming important to Clean Diesel. New technology and lower cost systems will drive revenue and earnings.

RECENT EVENTS

CDTi reported its first quarter 2016 results on May 13, 2016. Revenue was slightly ahead of our forecast at $9.7 million ($9.5 million was our estimate). SG&A excluding severance cost was the same as a year ago and higher than reported for 4Q15 whereas we had been looking for a lower number. Management has stated that the high operating expenses were a concern and they are looking to reduce it as a percentage of revenue.

The company affirmed its target revenue for 2016 of $39 to $43 million. This includes a major ramp in DuraFit revenue during the year. Gross margins should be in the 27% to 29% range. As powder coating becomes more important we would an increase in gross margin percentages.

	1Q13	2Q13	3Q13	4Q13	1Q14	2Q14	3Q14	4Q14	1Q15	2Q15	3Q15	4Q15	1Q16
HD Diesel revenue	$7.3	$7.1	$8.0	$10.2	$7.2	$7.0	$3.7	$3.5	$4.2	$3.8	$3.8	$4.9	$4.1
Operating Inc *	$0.3	$0.1	$0.7	$0.7	$0.3	$0.7	$0.7	$0.1	$0.4	$0.5	$0.7	$0.2	$0.8
Catalyst revenue	$6.5	$6.3	$7.2	$5.9	$5.8	$6.3	$6.2	$5.5	$6.8	$6.9	$6.7	$5.9	$6.5
Gross profit	$0.1	$0.1	$0.6	$0.2	$0.2	$0.4	$0.1	$1.4	$0.6	$0.2	$0.6	$0.3	$0.3
Sales to HDD Division	$0.4	$0.9	$1.0	$0.9	$0.5	$0.7	$0.6	$0.3	$0.6	$0.8	$0.7	$1.0	$0.9
External sales	$6.1	$5.4	$6.2	$5.0	$5.3	$5.6	$5.6	$5.2	$6.2	$6.1	$5.9	$4.8	$5.7

Operating income	($2.0)	($1.2)	$0.1	($0.0)	($1.1)	($0.5)	($1.6)	($3.1)	($2.7)	($2.1)	($2.9)	($1.1)	($2.4)
Pro forma Net income	($2.7)	($1.4)	($1.1)	($2.5)	($1.6)	($0.6)	($1.6)	($2.6)	($3.0)	($2.4)	($3.4)	($0.9)	($2.5)

The catalyst division is currently supplying Panasonic with SPGM DOC systems on coated substrate. Volume should be ramping up in the second half of the year. CDTi is working with Panasonic on other opportunities and we would expect some added products for them in 2017.

Management also stated that they hoped to add more partnerships in 2016. There are also some opportunities with the Spinel technology with major global OEM partners, but that is likely in the near future.

Kanis, S.A. and Clean Diesel have amended their loan agreement and Kanis will lend CDTi a further $2 million at 8% maturing on Sept. 30, 2017. This will take the pressure off CDTi needing further financing before it becomes cash flow positive late this year.

The amended agreement gives CDTi conversion rights of the aggregate principal balance of $7.5 million into common stock at a 25% discount to the price of any public offering or strategic investment.

Clean Diesel has received a "Notice of Delisting" from NASDAQ due to non-compliance with minimum stockholders equity requirements and for the low stock price not meeting required levels. This is not unusual and CDTi has 45 days to submit a plan to bring it into compliance.

On March 30, 2016 CDTi reported its fourth quarter results. Gross revenue before intra-company eliminations was better that expected but eliminations (sales of catalysts to the heavy diesel division) were much higher than normal because DuraFit sales increased more than expected. Net sales were $9.7 million, slightly below our estimate of $10 million.

Control of operating expenses, S.G.&A. was down 25% year over year, resulted in losses being much less than we had anticipated. These cost controls are expected to continue in 2016. We exclude termination expenses in our calculation of operating income and, on our basis, operating losses were $1.2 million.

The company expects revenue for 2016 in the $39 million to $43 million, which is better than our estimate of $38 million. Operating income is expected to be at break even by the fourth quarter of 2016.

We have increased our forecasts for revenue and earnings to reflect the higher level of revenue projected by the company.

CDTi and Hino Motors Ltd. have agreed that Hino will as a distributor of CDTi's DPF and DOC products, starting immediately. Hino is the commercial truck division of Toyota Motors and a manufacturer of medium duty trucks in the USA. It has over 300 dealerships in the USA.

Following the PACCAR agreement this is further evidence of CDTi's products gaining traction in the truck market. This relationship with a major vehicle producer within one of the world's largest auto and truck companies is a very positive move.

Following the tests, announced on June 20, 2015, CDTi has completed the next phase of testing of the Spinel catalyst. These tests are where the catalyst system is close to the exhaust manifold, which gets very hot. Using a 2015 Buick Regal (the "cold" test was done using a 2014 Regal, details on which engine was in the 2015 vehicle were not given) the results indicate that the Spinel catalyst can reduce the need for platinum group metals. No actual test data was given.

CDTi reiterated that it was developing coating relationships in N. America, China and India. Presumably the later two countries will, at first, be served through the relationship with Panasonic Ecology.

CDTi has announced the start of shipments of diesel oxidation catalysts (DOC) based on the SPGM technology to Panasonic Ecology systems. These sales are probably of coated systems and they should migrate to powdered products later this year.

The company expects to reach a low million dollar run rate of sales to Panasonic Ecology by the end of the year. We had estimated revenue of $3 million for the full year, biased towards the second half of the year and $5 million for 2017. We had considered these targets to be conservative given the size of the Chinese market for retrofit diesel pollution controls.

As part of the strategic transition from a manufacturer to a supplier of proprietary catalyst powder (P2C) CDTi will close its Markham, Ontario Canada facility and consolidate all its DuraFit operations at its Oxnard, California facilities. This is expected to save about $3 million a year going forward. A pretax charge to cover employee termination expenses and closing cost of $1.8 million will be taken in the 4Q15.

The company's President and COO, Mr. C.J. Harris and the General Council and VP of administration, Mr. P. J. Lopez-Baldrich have resigned. Both of them were long time employees of Catalyst Systems prior to the merger with CDTi. They will receive compensation packages based on prior compensation, potential medical expenses and bonus from 2015. In the case of Mr. Harris we assume his 2014 direct compensation of $300,000 is the basis for the 13 month portion and for Mr. Lopez-Baldrich his 2014 compensation was $268,000. It is not unusual for there to be management changes when there are CEO changes or changes in strategic directions.

The total non operating charges for the resignations are close to $959,333.

We have adjusted our forecasts to account for the closing of Markham and the resignation of the senior employees. We have assumed that all the expenses will be charged to the 4Q15.

In 2016 we should see significant sales of DuraFit products, especially through PACCAR Parts (part of PACCAR , NASDAQ PCAR $47.25) and the first commercial sales of product for P2C.

CDTi has announced that it will sell 883,862 shares plus prefunded warrants for $3.1 million. After expenses and commissions the offering is expected to raise $2.6 million. Our estimates have always assumed that the company will have to raise money to finance working capital, mainly inventory, in its quest to expand on a domestic and global basis. The rollout of sales agreements with national distributors will require stocking DPF and DOC units presale, the distribution centers will need stock and PACCAR will also need inventory.

The change from selling catalyst modules to selling powders will increase the lead time between shipments of powder and sale of catalyst systems.

We have not changed our revenue or net income assumptions but the increase in shares outstanding drops our per share valuations, As a result we have lowered our target price from $4 to $3 a share.

The Panasonic Corporation of Japan has been working on platinum free DPF systems for over 5 years and, in November 2015, announced that it has set up a new plant in China to produce filters for the Chinese diesel engine market with production starting in December, 2015.

Unfortunately, for Panasonic, a diesel oxidation catalyst is always paired with a DPF, and Panasonic does not have one. It has a Chinese engine manufacturer as a new customer that produces diesel engines for both on and off road vehicles so Panasonic had to find a supplier of a DOC.

So, on November 17, 2015 both companies announced that CDTi will supply DOC systems to Panasonic Ecology Systems (PEC), a subsidiary of the Panasonic Corporation. PEC has powder coating expertise but since it needs the DOC product now CDTi will supply the pre-coated SPGM oxidation catalyst at this time and later it will supply the powder only.

Panasonic is targeting 10 billion yen in sales in the fiscal year ending in March 2019. That's over 80 million USD!!

On November 13, 2015 CDTi announced its third quarter 2015 results, followed by a conference call. Our estimates of revenue were too high since we had included some legacy business. Pretax losses were $2.2 million versus our estimate of a loss of $2.3 million. Catalyst revenue was close to that of the first and second quarters and HD Diesel revenue was also flat as compared to a year ago. However, the 3Q15 included $1.7 million of DuraFit revenue, up from $1.0 million in 2Q15. The company has guided estimates to $5 million in DuraFit sales but we feel that this may be low since it was $3.7 million for the nine months of 2015.

CDTi confirmed its projections of $40 million to $45 million for the year and gross margins between 25% and 28%. Our estimates are $42 million and 28%. The 4Q15 should benefit from lower start-up expenses of the national roll-out of the DuraFit systems and revenue from the PAACAR agreement. There will be some revenue from PACCAR in the 4Q15.

The company also announced that the redesign of Honda models for the 2018 year will not, at this time, include CDTi catalytic systems. Honda was 60% of revenue so far in 2015, close to $6 a quarter. Since the 2018 model year is built starting in 2017 we have adjusted our model for the reduction. There will be some model carryover but not of the Honda Accord.

CDTi is in the process of transitioning from selling coated supports (matrix) direct to the OEMs to the new powder to coat (P2C) strategy. In the past the company has not had the international infrastructure needed to sell coated catalysts outside of the USA and Canada. It is now in discussion with coaters that are multinational in scope, including those in China and India. We expect some P2C revenue in late 2015. All of the company's catalysts, including the new Spinel and SPGM systems, can be coated onto substrates by third party coaters.

It is possible that Honda could be one of the customers for the new P2C catalysts, as could be other auto companies, Certainly VW/Audi need a new NOX system for the non-compliant diesel vehicles although it is not a trivial task to replace the urea injection system used in the past.

On Oct. 27, 2015 the company announced that it will be selling a new catalyst system. the DuraFit Direct Oxidation Catalyst, starting this quarter (4Q15). DOC and DPF systems are a $450 million market according to the company. The DuraFit DOC complements the particulate filter and helps to reduce harmful exhaust fumes. The DOC is an oxidizing (adds oxygen or removes hydrogen) catalyst system that converts the unburnt hydrocarbons and carbon monoxide from the combustion cylinders and converts it to water and carbon dioxide before it is emitted into the atmosphere. [H-C + O2 → H2O + CO2]. The company's DOC will use the reduced platinum (read lower cost) proprietary catalyst based on CDTi's synergized-platinum group metal (SPGM) technology coated onto an inert porous matrix such as fused silica.

CDTi will open four new distribution centers to better serve customers for the company's DuraFit diesel particulate filters. They will be located in New York, NY; Louisville KY; Colorado Springs CO; and Portland OR.

This is a major step for the company and it signals the potential of a strong franchise with significant sales growth over the next few years.

On Oct, 8, 2015 CDTi announced it had signed a distribution agreement with PACCAR Parts for the sale of company’s DuraFit diesel particulate filter. The agreement is for three years and includes the North American network of PACCAR Parts. This includes the more than 670 dealers that offer after market support for Peterbilt, Kenworth and DAF medium and heavy duty trucks.

PACCAR Parts is a division of PACCAR, both of which are substantial world-wide companies that provide a variety of services to the OEM and aftermarket truck industry. PACCAR has revenue of $19.99 billion, which includes the $3.1 billion business of PACCAR Parts. PACCAR built 142,900 new trucks in 2014 and is ranked as the third largest producer of medium and heavy duty trucks in the world.

This is the second distribution agreement for the distribution of DuraFit dpfs. The first, announced in May 2015, was for private label distribution. Shipment of the filters will start in 4Q15.

This is a very important agreement for CDTi. It opens up the opportunity of expanding dpf sales to the rest of the world through PACCAR Parts, adding other replacement parts such as catalyst systems and possibly supplying OEM parts and systems to PACCAR itself.

CDTi reported second quarter results on Aug. 6, 2015. We had estimated a pretax loss of $2.9 million and the company reported a loss of $2.6 million. Catalyst sales were better than anticipated due to higher sales of Honda automobiles in N. America. However this increased the

internal sales to the HDD side of the business, which was eliminated during consolidation. The decline of the California retrofit market was as expected. However, the sale of $1 million of DuraFit DPF units offset some of the drop.

The balance sheet inventory data includes significant dollars for sales of catalysts to AP Exhaust. This should include some powder products. Selling the catalyst powders to coaters will increase gross margins from the current level to as high as 40%

CDTi announced on June 8, 2015 that it has received certification of its Purifilter^{R} EGR diesel particulate filter from the Verification of Emission Reduction Technologies Association (VERT). This enables the company to sell the Purifilter line of products as retrofit systems in other countries besides the USA.

The VERT approval is applicable to both on-road and off-road engines throughout the world, although some additional approvals may be needed in some countries. Where major standards have not been set on a nationwide basis VERT is, in many cases, acting as a consulting agency to the government environmental authorities. This is especially so in China (a huge potential market), South America and the Middle East.

Many countries in South America have significant pollution problems in major cities, for example Mexico City. CDTi has relationships with many governments established from the company's work on Low Emission Zones (for example the London LEZ) and has many government approvals in heavy duty diesel emission control.

Given CDTi's recent news we would not be surprised if the company announces strategic partnerships to market its retrofit products.

On June 11, 2015 the company released an 8K that announced that on June 05, 2015 CDTi and Honda had agreed to extend their agreement for Honda to buy goods and related services (read catalysts) indefinitely. This is an extension of the agreement signed in December 2000. We believe that all agreements, contracts, product testing and purchase orders are through Honda's HQ in Japan. As such Honda engineers would be fully aware of the progress CDTi is making in reducing costs and increasing the effectiveness of its catalysts.

In our opinion, now that CDTi has full control of its Asian marketing and sales, the use of its catalysts could be extended to all Acura and derivative models and possibly to other Honda automobiles.

CDTI and AP Exhaust Technologies (owned by Audax Private Equity) have launched a program for the commercial introduction of replacement catalytic convertors based on the three major technologies developed by CDTi. These are the Mixed Phase Catalysts MPC, Spinel and BMARS.

We had expected some sales of the Spinel powder this year, as discussed in prior reports. This agreement is a much bigger deal than we had expected.

AP Exhaust will precision coat the substrates with the powdered catalysts provided by CDTi in its plant in Indiana and will apply for certification from the regulatory bodies.

The initial target market will be the light duty engine market, a market estimated at over 2 million units a year. We expect buyers will be independent repair shops and sales will be based on price. Auto dealers tend to buy OEM products.

On June 02, 2015 CDTi announced that initial test results for the Spinel catalyst showed that OEM performance could be achieved using two grams per cubic feet (2 g/ft3) catalyst loading on under floor systems for a 2014 Buick Regal 2 liter turbo charged engine and for a 2014 Toyota Camry with a 2.5 liter 4 cylinder naturally aspirated engine. The normal catalyst loadings used on the cars are 59 g/ft3 on the Buick and 22 g/ft3 on the Camry. The lower loadings represent a significant cost savings to the automobile manufacturers and the spinel catalyst has the potential of being a lower priced material with little or no platinum on the matrix. Testing is done on systems aged to represent 50,000 miles on a vehicle, which is the minimum required by current regulations.

CDTi has introduced a new family of catalysts that use rhodium as the active metal and contain much reduced levels on platinum group metals (platinum & palladium). These BMARS ^{TM} (Base Metal Activated Rhodium Support) materials can be made available as powders. Rhodium is similar in molecular metallic properties to palladium and ruthenium.

The BMARS system has been tested by independent laboratories using a 2014 Buick Regal with the new 2.0 liter turbocharged engine and a BMW Mini Cooper S with the well established 1.6 liter "Prince" turbocharged engine. The results show that the new catalysts reduces emissions (NOX, CO & HC) below regulatory levels by sufficient amounts to eliminate the second under-floor catalyst. The press release states that savings of over $200 per vehicle is possible. However, that may be a bit of a stretch since the UF system for the Buick costs $130 retail for the 50 state version and less than that for the 48 state model. The BMW Mini convertor retail cost varies from $62 (48 state, which excludes CA and NY but includes Europe) to between $145 and $200 for the full 50 state version.

The current BMARS units under test will pass the statutory requirements for Tier 3 US emissions which extend beyond 2018 on a nationwide basis. The current requirements are Tier 2. This includes cold start and full cycle standards. The current European standard is Euro 5 and the Mini test surpassed the Euro 6 requirements.

On May 14, 2015 the company announced that it has signed a three year agreement with a national private label distributor for the sale of DuraFit diesel particulate filters. These filters will not bear the name DuraFit (but prospective buyers will find out who built them). The DPF units will be sold into the heavy and medium duty vehicle market in N. America, with shipments starting in the second quarter of this year.

There will be a period of inventory building by the distributor followed by, hopefully, growing sales over the life of the agreement. About 250,000 vehicles using DPFs have been sold each year since 2007 with a warranty of five years so there is a ready market for replacement units.

On May 11, 2015 the company announced that it will be a supplier of diesel particulate filters to the New York City Department of Sanitation (DSNY). A regional distributor for CDTi [Mondial Automotive] will supply the DuraFit products to the DSNY fleet, which consists of 2,230 sanitation trucks, 1,388 other trucks and 2,360 other vehicles.

CDTi believes that the sanitation truck market in the USA is a $15 million to $20 million annual market. To target that, and other markets, the company is actively courting national truck parts distributors and expects to announce an agreement with a large independent distributor in the second quarter, 2015.

Clean Diesel has announced that its diesel oxidation catalyst SPGM^{TM} achieved oxidation results as good as the leading OEM manufacturer product at 20% of the cost. Heavy duty diesel engines produce a lot of residual hydrocarbons and soot and oxidizing this to carbon dioxide (and water) takes a lot of catalyst. Reducing the cost of the catalytic convertor is a significant benefit to the truck operator.

SPGM is not based on the Spinel technology that is currently being tested. Results for this catalyst should be available this quarter.

DuraFit did provide close to 15% of HD Diesel revenue and is expected to ramp up quarter by quarter in 2015. CDTi is close to securing, as a customer, its first major fleet operator through one of its independent distributors.

The company has made significant progress in developing a powder processing system for coating catalyst substrates. Instead of selling a coated ceramic system by selling a powder the customer can than coat its own substrate. There are many catalyst coaters world-wide that are not current customers and by providing the powder CDTi will expand its available market. The powders will all of the company's current catalysts as well as future ones that include Spinel derivatives. Since Spinel is a metallic crystalline matrix and is not soluble the use of powder deposition is an ideal method of coating the ceramic substrate.

The Spinel system is undergoing intensive accelerated testing using the same aging and drive cycle testing as used by the automobile companies. Some test results should be available mid 2015. The catalyst are being optimized for various engine types including small high performance direct fuel injected petrol engines as sold by the Japanese car companies.

In line with the potential markets using powders Clean Diesel has amended its agreement with TKK so the CDTi can sell its catalysts in Asia, including China. The company will pay a 4% royalty fee to TKK, up to a certain maximum.

CDTi has announced the launch of a new website to provide information about the benefits of the company's replacement filters together with links to video, sales literature and a product catalog. This will provide a valuable resource to expand and support CDTI's position in the rapidly growing market for the products.

Industry sources report that the market for after-treatment maintenance and repair was $500 million in 2010 and is expected to grow at 25% per year to reach $3.0 billion by 2017. The production of medium and heavy trucks had declined from 400,000 units in 2002 to 250,000 units in 2013 but is increasing to an over 330,000 annual rate by the end of 2014. The replacement market is expected to track heavy duty trucks production with a lag of about 3 years.

On Nov. 13, 2014 CDTi agreed with its principle lender, and largest stockholder, Kanis S. A. to extend the maturity dates on several notes in return for granting to Kanis S. A. warrants to purchase 80,000 shares.

The maturity dates on the 8% shareholder note of June 30, 2015 ($1.5 million), the 8% subordinated convertible note of April 11, 2016 ($3.0 million) and the 8% shareholder note of July 27, 2015 ($3.0 million) were extended to Oct. 01, 2016. In addition the early redemption feature of the convertible was removed.

The warrants have an exercise price of $1.75 for 5 years. We assume that the 80,000 shares would be registered if the warrants were exercised.

The extension of the notes and the probable cash from the warrants gives the company some breathing room and the capability of generating cash from possible royalties from the Spinel™ technology before the note become due.

The Donaldson Company [DCI] announced on Nov. 13, 2014 that it would close its Grinnell, Iowa, facility that manufacturers mufflers and exhaust products for off-road equipment. This is an affirmation of CDTi's decision the sell it Nevada facility.

CDTi is moving its diesel operations from an emphasis on the retrofit market to selling replacement systems for class 5 to class 8 trucks. The number of older trucks that do not have pollution control systems is declining rapidly and the new DuraFit products are aimed at the replacement market. This currently a 150,000 plus unit market with a value of $300,000 at the manufacturing level and $500,000 at the dealer sales level. The company has over 40 part numbers for various systems across a wide spectrum of trucks.

CDTi announced on Nov. 04, 2014 that it has sold 1.385 million common shares, series A warrants (an aggregate of 388,393 shares) and series B warrants (equal to 168,571 shares) for a total of $4.35 million gross and $3.8 million net proceeds. The sale was effective on Nov. 07, 2014. We have adjusted our numbers to reflect the increase in shares outstanding. Under accounting regulations share equivalents are not counted when a company reports a loss so the increase in shares outstanding will be 1.385 million.

On Oct. 30, 2014 CDTi announced that it the US Patent Office had granted it two patents on the company's catalyst systems that do not use Platinum Group (PGM) or rare earth metals (Lanthanides). These patents are the first to be granted of those that have been filed over the past few years on the family of Spinel™ technology. They can be applied to both gasoline and diesel engines.

The current technology uses combinations of metals that occur in small amounts or in very few places (or both) and are expensive. The trend over time has been to reduce the concentrations of the metals or replace them by other less expensive materials. By using metals such as Magnesium and Aluminium (this is the correct International name) that form a crystalline structure known as spinel, $MgAl_2O_{4..}$ Other similar metals such as Iron and Chromium are included in the crystal matrix found in nature and give the crystal its color. The semi precious spinel jewels are often found where rubies occur. Synthetic spinels were first produced in the mid 18 century.

We have often mentioned in our reports that CDTi has applied for patents on, or is working on, catalysts that do not include PGMs or rare earth metals. The current catalyst system supplied to Honda America is one step in the evolution of low to zero PGM catalysts. The Honda catalysts are capable of meeting the Level 3 requirements of the EPA.

The new Spinel ™ catalysts are currently being tested in vehicles. This is an exhaustive process that can take a year or more before being approved by the EPA. Auto manufacturers are very conservative in applying new technology, often freezing the use of a technology for three to five years. The current Honda Accord system was introduced in 2012, and it is unlikely that it will be replaced before the 2016 model year.

In our opinion this announcement is a significant one. Low cost antipollution catalyst can be used in many industries, from power stations to ULCCs. Many countries in Asia do not use catalysts on the ubiquitous 100 cc motorcycle, leading to major pollution problems in such cities as Manila and Bangkok. Even Ho Chi Min City, the largest city in Vietnam, is beginning to suffer from smog.

The new family of catalysts could be a major source of revenue and earnings, including licenses, starting in 2015 and gathering momentum for many years.

Clean Diesel announced on October 22, 2014 the sale of its Reno, Nevada operations for $1.3 million (subject to final review) to SES (Shuttleworth Exhaust Systems), which was also a distributor for CDTi. SES was divested from CES (part of CDTi) in 2007. Included in the assets of the deal is $0.4 million of intangibles. The Nevada operation produced custom exhaust systems and parts and was not integral to the diesel pollution control business. The operations being divested generated about $2.8 million in sales with an operating margin of 7% in the first nine months of 2014.

In the 8K filing the company outlined the 3Q14 revenue and operating loss. After adjusting for the divestiture revenue is expected to be $9.3 million with an operating loss of $2.5 million, which includes $0.8 million of non reoccurring charges such as severance. We have adjusted our forecasts to include the impact of the divestiture.

CDTi launched a new initiative on Aug. 5, 2014, the DuraFit^{TM} line of replacement diesel particulate filters (DPF). This is a $550 million annual market for out of warranty DPFs fitted as original equipment when an engine and truck were first purchased. A DPF has a lifetime of about five years so this is a sustainable market for CDTi. The diesel engine classes of 5 to 8 have a current market of about 150,000 units a year. These DPFs will be sold through the company's current sales channels and industry source expect this market to grow substantiality over the next five years.

The Changing of the Guard:

Over the past few years there have been an unusual number of changes at Clean Diesel, as summarized below.

In December, 2013 Craig Breese, the CEO, resigned.

The Principal Accounting Officer (who was also the Corporate Controller) gave notice on April 1, 2014 in order to accept a position at another company.

In May, 2014 Derek Gray, a Director since 1998, did not stand for reelection.

On July 7, 2014 Christopher Harris was appointed President and CEO. Mr. Harris was President of Catalytic Solutions. one of the predecessor companies.

The company announced on July 11, 2014 that the HQ would be relocated from Ventura, CA to Oxnard, CA (where its catalyst production facilities are located).

The CFO, who was also one of the two members of the Office of the President, resigned (with a generous compensation package) effective August 31, 2014 and will be succeeded by Mr. David E. Shea who was Corporate Controller at Catalytic Solutions prior to the formation of CDTI in 2010.

When companies change CEOs it is not unusual for there to be a realignment of responsibilities and changes in senior management, as well as changes in strategic directions. However, in this case the strategic plan has been, for some time, to emphasize the IP of the zero platinum group catalysts and to move away from unprofitable metal bending.

We do not expect the recent moves to have any major impact on the financials of the company in the near term.

The company's stock has been added to the Russell Microcap index. Each year Russell Investments rebalances the membership of its indices based of market capitalization as of the end of May. The membership remains in force for one year and then the indices are recast again. Investment managers use membership in the indices to form passive index funds and funds based on micro cap. investments. As such funds grow with new cash there is an inherent demand for stocks in the indices.

Diesel Emissions Reduction Act Grants (DERA 2012-2016)

In January 2010, President Obama signed legislation, H.R. 5809, reauthorizing DERA grants to eligible entities for projects that reduce emissions from existing diesel engines. The bill, passed by the Senate on December 16 and the House on December 21, authorizes up to $100 million annually for FY2012 through FY2016 and allows for new types of funding mechanisms. $29.9 million was appropriated by Congress for FY2012.

(Source: EPA web site)

R. Craig Breese has resigned his positions as CEO, President and member of the Board of Directors. Based on his employment agreement the Board of Directors has determined that his departure will be treated as termination without cause. In such cases it is usual that any stock options will not become vested or future options will not be granted. Nikhil A. Mehta CFO and Pedro J. Lopez-Baldrich, VP of Administration will act in the capacity as the Office of Chief Executive Officer.

Over the past few years the opportunities of vehicle pollution control in the London LEZ and the California CARB programs have illustrated the difficulties in sustaining a return on investment from mandated and unwanted abatement programs. In London the program was completed in a short period of time and future revenue is unlikely. CDTi did not make a profit from this program

and there is no follow-on business. The CARB initiatives have been resisted by the truck and bus operators and cumulative gross profit over the last 7 quarters is a loss. Only a significant cost cutting program had reversed the quarterly losses and some of the profit is probably due to the catalyst revenue from Honda.

In our opinion, the uncertainties of government mandated pollution control initiatives do not warrant a significant investment by small companies unless they can achieve market shares exceeding 25% to 30% of the revenue in such initiatives. Also, such initiatives as large as California's are few and probably not worth waiting for if they only generate $30 to $50 million in revenue.

The profitable future of Clean Diesel is in the catalyst business. However, it needs to expand its customer base to other programs within Honda and to other automobile companies. In general automobile companies are very slow to adopt new technology even when it saves them money.

We expect CARB retrofit revenue to increase significantly over the next few years. The off-the-road business should grow and the new EGR systems should be a significant contributor.

E Cube, the JV with Pirelli, has been dissolved. The poor business climate in Europe had made it impossible to meet the sales targets and a further review of CDTi's objectives suggested that E-Cube was not the best fit with the strategic plan. The loss from E-Cube was $0.4 million and this was about the same as what CDTi would have lost in Europe without the joint venture.

Honda uses a four to five year lifetime for model platforms. Although automobile manufacturers can change suppliers as they please any change in pollution control systems would require recertification of the platform. Consequently CDTi has a strong position on the Honda Accord for the next four years.

The public offering, with Roth Capital Partners, LLC as sole manager, consists of 1.6 million shares priced at $1.245 and warrants to purchase 0.8 million shares with an exercise price of $1.25. The warrants are immediately exercisable for a period of five years. The underwriters have a 30 day option to acquire 240,000 shares and 120,000 warrants. CDTi has also agreed to convert $0.235 million in principle and interest to common stock and to sell $100,000 of common stock to a director, Dr. Lon Bell, in a private placement.

The company has completed the strategic review of its businesses and has decided to "pursue aggressive development of its unique materials science platform". Clean Diesel is a leader in zero platinum group metal (ZPGM) catalyst systems but has no competitive edge in metal bending.

The skill in making catalyst systems is how to deposit the catalyst on a substrate, which may be silica or silicon carbide (of which there are many suppliers). Clean Diesel has patented its processes and the composition of the catalysts. As such they are a leader in the market.

Clean Diesel Inc. has changed its name to **CDTi** although its legal name remains Clean Diesel Inc.

Both Honda and Clean Diesel have announced that Clean Diesel will supply a new palladium only catalyst system (invented by CDTi), first for the 2013 model Accord currently being built in North America, and then to other Honda models. The new system will reduce precious metal content by 22% and Rhodium content by 50%. This cuts the cost of the system by 37% while complying with some of the most stringent emission regulations in the world. This business will have a significant impact on Clean Diesel's revenue and profit. Over the past two years the company has been impacted by the problems in Japan that had an effect on parts availability. This catalyst will be used in other Honda cars, presumably Accords being built in other countries, on a sequential basis. In August 2012 Honda sales increased by 59.5% to 131,321 vehicles, the Accord increasing by 89%. The seasonally adjusted sales rate was 14.52 million vehicles as compared to 12.8 million vehicles in 2011.

Clean Diesel Technologies and American Infrastructure Leasing (AIL) have partnered to supply equipment leases on Clean Diesel's ECS-branded diesel particulate filters (DPF) to vehicle and fleet owners in North America. American Infrastructure Leasing has a strong franchise in providing capital to the vehicle and fleet owners. Using capital from AIL truckers can acquire DPF equipment on attractive terms.

KEY POINTS

- Pollution impacts life expectations.
- Pollution control is driven by regulation on a national, regional and city basis.
- Gasoline engine emission control is a mature market in the U.S., Europe and Japan.
- For CDTI the auto market is an OEM market but the diesel market is an after-market business.
- Other countries like China and India are starting pollution abatement initiatives.
- The higher the standards the more advanced is the technology (at a higher cost) and this is a barrier to entry for small companies .
- Changing emission standards over the next five years will drive revenue and earnings significantly higher.

OVERVIEW

There are many ways to convert a fuel to power that can be used to produce motion. These include engines that run on gasoline, diesel and bio-diesel, kerosene, steam, electricity, propane (and butane) and compressed natural gas. There are many engine types including internal combustion engines such as two stroke, four stroke, diesel, Wankel rotary, jet engines as well as external combustion engines such as the Stirling cycle engine and steam generators where the fuel is burnt to produce heat in a secondary fluid which then drives a turbine to produce electricity.

The problem with all engines based on burning a fuel is that a product of combustion is pollution. This is usually a combination of un-burnt fuel (usually hydrocarbons, HC), carbon monoxide (poisonous, CO) and various oxides of nitrogen (that produce brown smog, NOx). Certain fuels also produce particles of soot (carbon) produced by incomplete combustion of the fuel. Burning coal (or wood) to produce steam that drives a turbine that produces electricity also produces ash that has to be removed from the exhaust gas.

Pollution poses health hazards. The EPA estimates that diesel pollution is the cause of 12,000 premature deaths; 280,000 child respiratory cases and 200,000 child asthma cases (although there may be some double counting here) and a loss of 1,000,000 workdays. California air pollution costs are estimated to be as high as $130 billion. According to the WHO particulate matter (PM) reduces life expectancy by 8.6 months for every person in the European Union (EU) and that the EU could save up to $225 billion a year by reducing air-pollution related deaths.

Despite all of the estimated benefits of controlling air pollution the business is driven by government regulation. This is because pollution control is an expense that is not offset by significant improvements in productivity and is an expense that is a capital and operating cost to the operator.

The US imposed automobile exhaust control starting with the 1975 model year (production starting in mid 1974). General Motors decided to use a catalytic converter developed by the Engelhard Corporation for use on forklifts in warehouses and this forced all the other auto companies to use the same technology. The early catalysts used relatively large amounts of platinum and so they were expensive. Over the years the driver has been to reduce the cost by using other platinum group metals as well as non-precious metals. The first catalyst were 2-way catalyst that converted HC and CO into carbon dioxide and water. Later developments resulted in 3-way catalysts and engine modifications that reduced the emission of NOx.

This was followed by diesel engine emission controls. A diesel engine is a compression ignition engine. There is no spark plug. Compressing the air/fuel mixture in the first upstroke causes it to heat up and explode so diesel engines are more robust than gasoline engines. The cylinder temperatures are much higher in diesel engines and this causes more NOx to be formed. Diesel exhaust also contains more oxygen than gasoline engine exhaust. Too much oxygen is a problem for 3-way catalysts so they cannot be used on a diesel engine. However, 2-way catalysts work well and are used to control HC and CO. The energy during combustion also converts some HC to carbon and this soot (PM) has to be removed.

Regulations have been imposed on stationary power sources such as engines used in mining (drag lines for example), construction equipment, railway engines and off-road vehicles and ships.

Other countries impose pollution control. Although often criticized, China has an active vehicle pollution control program (based on European standards) that started in 2010 and may be upgraded in 2012.

Pollution control is driven by legislation

ARB Estimate[1] of Class 7 & 8 HD Trucks in California with Mandatory Retrofit Requirement from 2012 thru 2014[2]

Model Years	Class 8 (>33,000lbs)	Class 7 (26,000-33,000lbs)	Total
2003 – 2006	53,404	9,625	63,029
1998 – 2002	36,488	11,527	48,015
1997 and older	37,470	22,317	59,787
Total Number of Trucks			170,831

Note:
- Only includes California-based trucks
- Trucks outside California meeting certain criteria must also comply with retrofit requirements
- Does not include school buses which also must comply with retrofit requirements
- Assumes trucks remain in use

CDT management estimates that CDT CARB verified products can address the emission requirements of over 70% of the vehicles estimated above.

[1]Analysis based upon draft vehicle population estimate provided by Mobile Source Analysis Branch of ARB. Numbers are based upon an extrapolation of 2005 DMV registration data and reflect an approximate estimate only.
[2]CARB Truck and Bus Regulation requires compliance of 90% of vehicles with diesel particulate filters by 2014**.**

Company Background

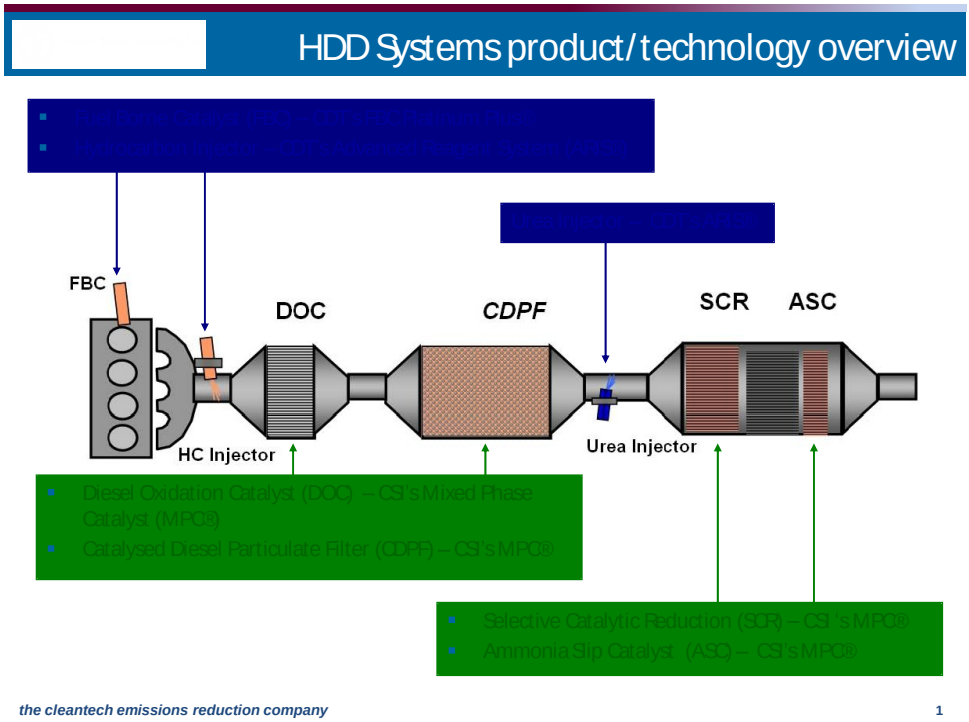

The company is organized into two divisions. The Heavy Duty Diesel Systems division is a leader and manufacturer of verified exhaust emissions control systems for the retrofit and OEM markets though a distribution and dealer network that includes PAACAR and International, two of the largest heavy truck manufacturers in the US. The Engine Control Systems (“ECS”) and Clean Diesel Technologies-branded products, such as Purifilter ® , Purifier and ARIS ® and exhaust gas recirculation with selective catalytic reduction are used to reduce exhaust emissions created by on-road, off-road and stationary diesel and alternative fuel engines including propane and natural gas. The company also promotes the Platinum Plus ® range of fuel-borne catalyst solutions into global markets.

Auto catalyst technology is being driven by lower prices and, therefore, lower costs. Platinum group metals are very expensive, volatile in price and most of the mining is outside of the largest markets with many mines in areas of political instability. The key to success is to replace the precious metals with base metals of a significantly lower price. Since the 2-way auto catalyst technology can be used in diesel applications the cost benefits can differentiate Clean Diesel from its competitors in both markets. The company is in the process of having its catalyst technology verified to be used in systems for diesel vehicles. This will allow the Catalyst division to be a supplier to the Diesel division thus improving profit margins. The ability to use its own catalyst will enable Clean Diesel to design its own systems, customizing the pollution control equipment and this will have a significant positive impact on profits.

The Catalyst division includes the company's proprietary MPC ® technology. This technology enables Clean Diesel to produce catalyst formulations for gasoline, diesel and natural gas induced emissions that offer superior performance, proven durability and cost effectiveness for multiple markets and a wide range of applications. The company has developed a family of unique high performance catalysts using base-metals or low platinum group metal and zero-platinum group metal content to provide increased catalytic performance and value for technology-driven automotive industry customers and for the Heavy Duty Diesel Systems division.

The Diesel division offers a wide range of technology, some of which are not currently approved for use in the US. The range of products and technology is shown below. Applications include on-road (the largest market); off-road (second largest market); stationary units, propane and natural gas fueled engines (both on and off road application) and clean fuels such as bio-diesel. Not only do the exhaust emissions have to be controlled but other combustion related problems, such as crankcase ventilation gases have to be enclosed and treated. Clean Diesel has a system, its ECS ventilation system that eliminates 100% of crankcase emissions which has a major impact on cabin air quality. These systems are EPA approved.

INDUSTRY OUTLOOK

INDUSTRY OUTLOOK - POSITIVE

Both legislative initiatives and economic growth have positive impacts on the demand for, and use of, both on road and off road vehicles and machinery over the next three to four years.

For Clean Diesel the automobile (light vehicle) catalyst market is an OEM market. The systems take one to two years to develop and receive certification and are frequently designed for a particular model of automobile. Once designed in and approved the automobile company usually keeps that configuration and supplier for the life of that model. Auto production in N. America, W. Europe and Japan of gasoline engines is a flat to declining business as diesel engines penetrate the market. In several EU countries diesel engines have achieved more than a 50% penetration of new car sales. Although market penetration of diesel cars is low in the US the high price of gasoline is a strong incentive for adoption of diesel technology now that the EPA has approved the current pollution control technology used in Europe and low sulfur/low phosphorous diesel fuel is now available in the US. Sulfur poisons precious metal catalysts. The removal of phosphorous is also beneficial as it prevents an ash problem in the exhaust. Volkswagen, Mercedes, Audi and BMW offer diesel alternatives to their gasoline engines. The VW Jetta is selling well, for the first five months of 2011 sales are up nearly 70% year over year, and 50% are diesels, and dealer inventory of this model is very low.

The heavy truck market is an after-market business. Class 7 & 8 trucks, those over 26,000 lbs, have a long life. The engines can run over 50,000 miles before needing a major overhaul. As a result there are many trucks older than 10 years. As an example 35% of the HD trucks in California are over 14 years old. This is a significant and growing market for retrofit pollution control equipment. The cost to the

operator for a total system for a class 8 truck driven in California can exceed $10,000 per vehicle. The total available market for diesel retrofits in California alone could exceed $1.15 billion over the period 2012 through 2014. However, many old trucks are likely to be scrapped, some may be re-engined and some replaced by new equipment. The EPA has estimated that 20 million vehicles with diesel engines do not meet the new emission standards. Although the standards for California are the most stringent in the US, and require the most expensive retrofit equipment, other states have matched them. Using an equipment price well below the mid-point of the cost range the market for heavy duty vehicle diesel retrofits in N. America could exceed $150 billion over the next ten years. And Europe has even more stringent requirements that will require a higher level of technology. And higher levels of technology mean higher costs.

Johnson Matthey, the world's largest producer of platinum group metals has estimated that the world-wide market for exhaust catalyst systems could exceed $2.5 billion in 2016.

The 10 largest manufacturers of trucks over 16 tons GVW produced 2.16 million trucks in 2009, with Daimler AG and the Volvo Group having over 40% of the market. Daimler estimates that the medium and heavy duty vehicle market will grow from 2.1 million units in 2010 to 2.6 million units in 2013. The eight million trucks sold over this period will face tighter emission standards in 2017 and beyond, as will many other HDD trucks produced before 2010. In most cases these statistics do not include buses. By the end of 2013 the US, Europe, China, India and Brazil will face new, more stringent, standards for NOX and particulate emissions to take effect in 2014. There are 13 countries plus California, Beijing, Indian cities and S. Korea (gasoline engines) that will require new emission equipment by the end of 2015.

As well as on-road vehicles there are other sources of emissions including locomotives, ships, off-road vehicles and mining and construction vehicles, both movable and stationary.

INDUSTRY POSITION

The emission retrofit market is highly fragmented. Although Clean Diesel Technology is probably one of the top three world wide providers of vehicle emission technology and products there are many small companies and divisions of larger companies that compete in some sectors.

VALUATION

Using on a price/sales ratio of 1.0 the current median value of the peer group) and 2015 revenue of $41 million results in a stock value of close to $3 a share using the share count of 17 million.

RISKS

The company has a number of significant financial risks.

- It will need additional funding to cover near term losses. The company does not have positive cash flow from operations and will need to reduce costs and grow revenue to achieve profitability.
- The auditor's report often includes a "going concern" caution over the past few years.
- The company has been dependent on a few major customers and the loss of one of these customers would have a significant impact on profitability.

INSIDER TRADING AND OWNERSHIP

Directors and Officers and 5% owners own 16% of the outstanding stock. As of the last report there are no institutional or mutual funds that own more than 2% of the outstanding stock.

Recent insider sales are all exercised option related.

There were no direct insider buys.

HISTORICAL ZACKS RECOMMENDATIONS

© Copyright 2016, Zacks Investment Research. All Rights Reserved.

DISCLOSURES

The following disclosures relate to relationships between Zacks Small-Cap Research ("Zacks SCR"), a division of Zacks Investment Research ("ZIR"), and the issuers covered by the Zacks SCR Analysts in the Small-Cap Universe.

ANALYST DISCLOSURES

I, Ian Gilson, hereby certify that the view expressed in this research report accurately reflect my personal views about the subject securities and issuers. I also certify that no part of my compensation was, is, or will be, directly or indirectly, related to the recommendations or views expressed in this research report. I believe the information used for the creation of this report has been obtained from sources I considered to be reliable, but I can neither guarantee nor represent the completeness or accuracy of the information herewith. Such information and the opinions expressed are subject to change without notice.

INVESTMENT BANKING AND FEES FOR SERVICES

Zacks SCR does not provide investment banking services nor has it received compensation for investment banking services from the issuers of the securities covered in this report or article.
Zacks SCR has received compensation from the issuer directly or from an investor relations consulting firm engaged by the issuer for providing non-investment banking services to this issuer and expects to receive additional compensation for such non-investment banking services provided to this issuer. The non-investment banking services provided to the issuer includes the preparation of this report, investor relations services, investment software, financial database analysis, organization of non-deal road shows, and attendance fees for conferences sponsored or co-sponsored by Zacks SCR. The fees for these services vary on a per-client basis and are subject to the number and types of services contracted. Fees typically range between ten thousand and fifty thousand dollars per annum. Details of fees paid by this issuer are available upon request.

POLICY DISCLOSURES

This report provides an objective valuation of the issuer today and expected valuations of the issuer at various future dates based on applying standard investment valuation methodologies to the revenue and EPS forecasts made by the SCR Analyst of the issuer's business.
SCR Analysts are restricted from holding or trading securities in the issuers that they cover. ZIR and Zacks SCR do not make a market in any security followed by SCR nor do they act as dealers in these securities. Each Zacks SCR Analyst has full discretion over the valuation of the issuer included in this report based on his or her own due diligence. SCR Analysts are paid based on the number of companies they cover. SCR Analyst compensation is not, was not, nor will be, directly or indirectly, related to the specific valuations or views expressed in any report or article.

ADDITIONAL INFORMATION

Additional information is available upon request. Zacks SCR reports and articles are based on data obtained from sources that it believes to be reliable, but are not guaranteed to be accurate nor do they purport to be complete. Because of individual financial or investment objectives and/or financial circumstances, this report or article should not be construed as advice designed to meet the particular investment needs of any investor. Investing involves risk. Any opinions expressed by Zacks SCR Analysts are subject to change without notice. Reports or articles or tweets are not to be construed as an offer or solicitation of an offer to buy or sell the securities herein mentioned.
