Durect Corp (DRRX-NASDAQ)

DRRX: Zacks Company Report

DRRX: *DUR-928 on track to enter Phase II studies, and holds great potential for long term growth. We are still optimistic about DRRX even with the failure of POSIMIR program.*

OUTLOOK

Durect is a late stage biotech company with Remoxy approval expected in 2019.

We are especially optimistic about the company's epigenetic regulator DUR-928, which holds great market potential for multiple indications, including NAFLD/NASH and acute kidney injury. Multiple Phase II trials will be initiated in 2017.

We continue to be positive about the Durect story.

WHAT'S NEW

Update on POSIMIR®

On Oct. 19, 2017, DURECT reported that PERSIST, the **Phase III** clinical trial for POSIMIR® (SABER®-Bupivacaine), did not meet its primary efficacy endpoint of reduction in pain on movement over the first 48 hours after surgery as compared to standard bupivacaine HCl. While results trended in favor of POSIMIR versus the comparator, they did not achieve statistical significance.

The Posimir (SABER®-Bupivacaine) Program

The company **completed** the enrollment of patients in PERSIST, a POSIMIR **Phase III** clinical trial consisting of patients undergoing laparoscopic cholecystectomy (gallbladder removal) surgery in June 2017.

In a previous clinical trial of 50 patients in the same surgical model (laparoscopic cholecystectomy), POSIMIR was compared with the active control bupivacaine HCl, against which POSIMIR demonstrated in a post hoc analysis an approximately 25% reduction in pain intensity on movement for the first 3 days after surgery (p=0.024) and for the first 2 days after surgery (p=0.0198), using the same statistical methodology specified for the current trial.

POSIMIR is the company's investigational post-operative pain relief depot that utilizes the company's patented SABER technology and is intended to deliver bupivacaine to provide 3 days of pain relief after surgery.

In May, 2017, Durect announced a development and commercialization agreement with Sandoz AG, a division of Novartis (NVS), to develop and market in the United States Durect's POSIMIR® (SABER®-Bupivacaine). Under the terms of the agreement, Sandoz will make an upfront payment to DURECT of $20 million, with the potential for up to an additional $43 million in development and regulatory milestones, up to an additional $230 million in sales based milestones, as well as a tiered double digit royalty on product sales in the **United States**.

With the failure of the Phase III trial, we believe DURECT will terminate the development of POSIMIR and shift its focus to the company's epigenetic program DUR-928.

Focus will Be Shifted to DUR-928 Development Program

Among Durect's multiple candidates, DUR-928 may be the most promising one in our view because this compound has the potential to target multiple indications including NAFLD/NASH and acute kidney injury.

The Background

DUR-928 came from DURECT's Epigenetic Regulator Program, which is a collaborative effort between DURECT and the Department of Internal Medicine at Virginia Commonwealth University (VCU), the VCU Medical Center, and the McGuire VA Medical Center. During the course of this program, a number of compounds that may have therapeutic utility have been identified, including the lead molecule DUR-928. DURECT holds the exclusive worldwide right to develop and commercialize DUR-928 and related molecules discovered in the program.

DUR-928 is an endogenous (produced naturally by the body), orally bioavailable small molecule that modulates the activity of several nuclear receptors that play an important regulatory role in lipid homeostasis, inflammation and cell survival. Studies have showed that DUR-928 modulates the activity of more than 240 genes, including ACC, FAS, HMGR, Cyp7A1, LXR, PPARγ, NFκB/IκB, TNFα, IL-1α, IL-6, COX-2, PCSK9, and others.

The broad biologic activities indicate that DUR-928 may have a broad range of clinical applications including acute organ injury, ischemia or reperfusion injury, and chronic liver disease such as non-alcoholic fatty liver disease (NAFLD) and non-alcoholic steatohepatitis (NASH).

Update on Phase Ib Oral Study of DUR-928 for NASH

In January, 2016, Durect initiated a single-ascending-dose **Phase Ib** clinical trial with oral DUR-928 in patients with nonalcoholic steatohepatitis **(NASH)** in **Australia.**

This Phase Ib trial of DUR-928 was a dose ranging (50 mg and 200 mg), single-ascending-dose safety and pharmacokinetic (PK) study of **oral DUR-928** in subjects with NASH and matched control subjects (MCS). This study was conducted in successive cohorts evaluating single-dose levels (first a low dose and then a high dose) of oral DUR-928. Both cohorts consisted of 10 NASH patients and 6 MCS.

Table 1. Patient Demographics (mean ±SD)

	Cohort 1 (50 mg)		Cohort 2 (200 mg)	
Demographics	NASH	MCS	NASH	MCS
# of Patients	10	6	10	6
Age (yrs)	53.4 (10.7)	56.8 (6.5)	53.2 (12.9)	54.7 (6.0)
BMI (kg/m2)	34.7 (6.2)	31.2 (2.4)	36.6 (6.4)	33.2 (4.4)
Gender (M/F)	5/5	5/1	5/5	3/3
Baseline ALT (U/L)	66.7 (18.9)	19.3 (6.5)	78.9 (45.5)	20.8 (4.8)
Cirrhotic Patients	2	--	3	--
Non-Cirrhotic Patients	6	--	5	--
Undetermined	2	--	2	--

On April 24, 2017, Durect presented the updated **Phase Ib** data at the International Liver Congress™2017 (the 52nd annual meeting of the European Association for the Study of the Liver (EASL)) in Amsterdam.

In both cohorts, DUR-928 was **well tolerated overall**. There was approximately a 10-30% increase in DUR-928 exposure in NASH patients compared to MCS. A single serious adverse event (shortness of breath), designated as possibly related to study drug, was reported in Cohort 2 in a NASH patient with a prior history of arrhythmia and an ongoing viral infection; no unusual abnormal biochemistry was observed and the symptom spontaneously resolved.

Table 2. Pharmacokinetic Parameters (mean ±SEM)

	Cohort 1		Cohort 2	
PK Parameters	NASH	MCS	NASH	MCS
Cmax (ng/mL)	113.2 (36.3)	94.0 (27.4)	332.7 (99.5)	260.5 (54.8)
Tmax (hr)	2.4 (0.8)	3.0 (1.1)	2.9 (1.2)	2.7 (1.0)
T½ (hr)	1.6 (0.2)	1.7 (0.3)	1.9 (0.4)	1.7 (0.4)
AUClast (ng*hr/mL)	512.7 (219.1)	476.5 (187.6)	1723.7 (470.9)	1316.9 (203.4)
AUCinf (ng*hr/mL)	528.1 (216.4)	487.9 (190.2)	1732.6 (470.5)	1325.5 (202.9)

Exploratory biomarker analysis indicated that a single oral dose of DUR-928 resulted in reductions from baseline in the levels of both full-length and cleaved cytokeratin-18 (CK-18), bilirubin, hsCRP and IL-18 in NASH patients.

- The decrease of full-length CK-18 (a generalized cell death marker) at 12 hours was approximately 33% in the NASH patients in the low dose cohort and approximately 41% in the high dose cohort. The decrease of cleaved CK-18 (a cell apoptosis marker) at 12 hours was

approximately 37% in the NASH patients in the low dose cohort and approximately 47% in the high dose cohort.

- The decrease in total bilirubin (a liver function marker for which a decrease would be seen as positive) at 12 hours in the NASH patients was approximately 27% in the low dose cohort and approximately 31% in the high dose cohort.
- High sensitivity C-Reactive Protein (hsCRP), a marker of inflammation, trended higher at 12 hours in the NASH patients by approximately 3% in the low dose cohort but trended lower by approximately 12% in the high dose cohort.
- IL-18, an inflammatory mediator implicated in both liver and kidney diseases, trended lower at 12 hours by approximately 5% in both the low dose cohort and in the high dose cohort.

Animal Data Further Indicate DUR-928's Potential for NASH

In March 2017, at the AASLD Emerging Trends in Non-Alcoholic Fatty Liver Disease Meeting, Durect presented a poster in a STAM mouse model with DUR-928.

The animal study was designed as a two-phase study.

- **Phase I**: Weeks 5–9, daily oral doses of 10 or 50 mg/kg DUR-928 or Vehicle (n=8-9/treatment group)
- **Phase II**: Weeks 9–13, daily oral doses of 50 mg/kg DUR-928 or Vehicle (n=6-8/treatment group)
- Studies were terminated upon completion of dosing
- Baseline measurements were collected from untreated STAM™ mice at Week 9

Data from the animal study were pretty impressive.

Phase I – Weeks 5-9

- Four weeks of daily oral DUR-928 treatment during the early stages of NAFLD/NASH exhibited dose-dependent effects:
  - Significant decrease in NAS
  - Trend of decrease of liver fibrosis was observed
  - Significant reduced hepatic expression of *Tnfα* and trend of decrease of *Mcp-1*

Phase II – Weeks 9-13

- Four weeks of daily oral DUR-928 treatment when liver fibrosis was established resulted in:
  - Significant decrease in liver fibrosis
  - Significant decrease in hepatocyte ballooning
  - Trend of reduced hepatic expression of fibrotic genes, Collagen 1a1 and 3a1
- Hepatic nodule formation, which progresses to hepatocellular carcinoma in this model, was also reduced in total number, size and incidence in DUR-928-treated mice

Also, in a recently published paper in the journal Metabolism (71(2017) 83-93), DUR-928 has demonstrated great potential to treat liver injury in an animal model:

- The mortality effect for DUR-928 in the animal model was striking,
- Only 10% of the animals survived at 96 hours without DUR-928 vs 90% survival with DUR-928,
- These results suggest the utility of DUR-928 for multi-organ injury,
- These results show the potent anti-inflammatory effect of DUR-928 (shown as significant reduction of cytokines and inflammatory cell infiltration in the tissues),

The data from the Phase Ib trial and the animal studies are encouraging in our view. Collectively, the reduction of these biomarkers plus results from the company's animal and cell culture studies suggest potential therapeutic activity of DUR-928 for patients with liver disease.

Update on Phase Ib Injectable DUR-928 for Kidney Disease

This ongoing trial is also conducted in **Australia**.

This **Phase Ib** trial of DUR-928 is an open-label single-ascending-dose safety and pharmacokinetic study in patients **with impaired kidney function** (stage 3 and 4 chronic kidney disease) and matched control subjects. This study will be conducted in successive cohorts (first a low dose and then a high dose) evaluating single-dose levels of DUR-928 administered **by injection.**

The company recently **completed the Phase Ib** study. The low dose cohort enrolled 6 kidney function impaired patients and 3 matched control subjects, and the high dose cohort enrolled 5 kidney function impaired patients and 3 matched control subjects.

In this trial, DUR-928 was well tolerated among all subjects and the PK parameters between the kidney function impaired patients and the matched control subjects were comparable.

In addition, Durect has held a pre-IND meeting with the Cardiovascular and Renal Products Division of the FDA, and the company is utilizing feedback from that meeting as well as from its clinical advisors to prepare an IND which is required to enable a future kidney disease clinical trial **in the United States**.

Topical Formulation

Durect **completed** an initial **exploratory Phase Ib** trial in **psoriasis** patients (n = 9 evaluable patients) in Australia. The decision to proceed with clinical testing in psoriasis was based on the anti-inflammatory and cell survival properties of DUR-928, including the downregulation of IL-17, full length CK-18, cleaved CK-18, as well as the results of a psoriasis study with DUR-928 in mice.

The **Phase Ib** trial was conducted with intradermal micro injections of DUR-928, and the company thinks the results warrant further investigation. As a result, the company has developed several topical formulations of DUR-928 that the company is evaluating for a topical application microplaque trial which will commence this year.

There is a large unmet medical need for new topical drugs for psoriasis for use prior to systemic biologic treatments which often have significant associated side effects.

Future Development Plans

Durect is working with its clinical advisors to design several **Phase II** studies and is planning to submit INDs which are required to enable these studies to take place in the United States in 2017.

Durect plans to conduct **at least one Phase II** trial in 2017. The company is actively working towards a **Phase II** trial in Primary Sclerosing Cholangitis **(PSC)**, with an **oral formulation** of DUR-928. PSC is a chronic liver disease characterized by a progressive cause of cholestasis (decrease in bile flow) with inflammation and fibrosis of bile ducts. It is an orphan medical condition for which there is no established medical treatment.

The company also plans to select lead **topical formulations** for DUR-928 that will be taken into a proof-of-concept clinical trial in psoriasis patients in 2017.

Large Market Opportunity for DUR-928

Although DUR-928 may have broad applications in many indications, we believe the initial focus will be in **NAFLD/NASH** and acute **kidney injury**.

Non-alcoholic fatty liver disease (NAFLD) is the build-up of extra fat in liver cells that is not caused by alcohol. It is normal for the liver to contain some fat. However, if more than 5% - 10% percent of the liver's weight is fat, then it is called a fatty liver (steatosis). The more severe form of NAFLD is called non-alcoholic steatohepatitis (NASH). NASH causes the liver to swell and become damaged.

NAFLD affects about 30% of adults and 10% of children in the US, among which 10-30% will develop NASH. 25-40% NASH patients will develop progressive liver fibrosis, while 20-30% NASH patients with advanced fibrosis will develop cirrhosis, which could lead to liver cancer.

Currently there are no FDA approved medicines for the treatment of NAFLD/NASH.

Acute kidney injury (AKI) is defined as an abrupt or rapid decline in renal filtration function. This condition is usually marked by a rise in serum creatinine concentration or by azotemia (a rise in blood urea nitrogen [BUN] concentration).

Per Medscape, in the United States, approximately 1% of patients admitted to hospitals have AKI at the time of admission. The estimated incidence rate of AKI during hospitalization is 2-5%. AKI develops within 30 days postoperatively in approximately 1% of general surgery cases and arises in up to 67% of intensive care unit (ICU) patients. Approximately 95% of consultations with nephrologists are related to AKI. The appropriate nephrologist referral rate is approximately 70 cases per million populations.

The current treatment for AKI is mainly supportive in nature. No therapeutic modalities to date have shown efficacy in treating the condition. Therapeutic agents (eg, dopamine, nesiritide, fenoldopam, mannitol) are not indicated in the management of AKI and may be harmful for the patient.

Certainly, there are highly unmet medical needs in the NAFLD/NASH and acute kidney injury fields. The unique mechanism of action and the compelling animal and human data so far make DUR-928 a highly promising candidate for the management of NAFLD/NASH and kidney injury.

Update on Remoxy

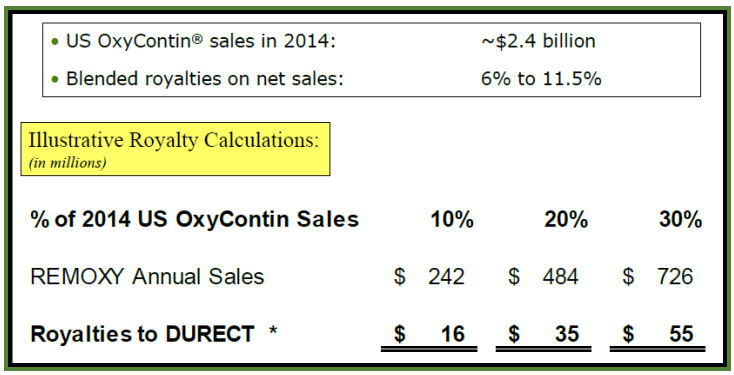

In March 2017, the company's partner Pain Therapeutics announced that it plans to resubmit the REMOXY ER NDA after completing two additional studies regarding REMOXY ER based on guidance obtained in a recent meeting with the FDA. The two studies were a clinical abuse potential study via the intranasal route of abuse and a non-clinical abuse potential study using household solvents. Pain Therapeutics stated that it expects to complete these studies by year end 2017, after which it intends to have a pre-NDA meeting with the FDA followed by resubmission of the REMOXY NDA.

Based on DURECT's ORADUR®technology, REMOXY (oxycodone extended-release capsules) is a unique oral, long-acting formulation of oxycodone designed to discourage common methods of tampering associated with opioid misuse and abuse. REMOXY is designed to manage pain severe enough to require daily, around-the-clock, long-term opioid treatment and for which alternative treatment options are inadequate.

Chronic pain affects as many as 100 million Americans annually. When chronic pain is severe enough, patients are frequently prescribed long-acting opioid analgesics. Opioids (also called narcotics) include oxycodone, hydrocodone, hydromorphone, oxymorphone, morphine, fentanyl, methadone, and other members of this class.

While opioids are effective at treating pain, they are also widely misused and abused. The FDA has recently described this situation as the opioid abuse epidemic, and called for a far-reaching action plan to reassess the agency's approach to opioid medications. One element of this action plan includes expanding access to, and encouraging the development of, abuse-deterrent formulations of opioid products.

The extended release oxycodone market is ~$2.4 billion in the U.S. alone. We believe that REMOXY represents a $500-750 million drug, of which Durect is entitled to 6-11.5% royalties on commercial sales once launched.

Update on ORADUR-ADHA Program

In 2013, Durect selected a formulation for the lead program in its ORADUR-ADHD program, ORADUR-Methylphenidate. This formulation was chosen based on its potential for rapid onset of action, long

duration with once-a-day dosing and target pharmacokinetic profile as demonstrated in a Phase I trial. In addition, this product candidate utilizes a small capsule size relative to the leading existing long acting products on the market and incorporates the company's ORADUR anti-tampering technology.

Orient Pharma, the company's licensee in defined Asian and South Pacific countries, has reported that a **Phase III** study conducted in Taiwan has achieved positive results.

Durect retains rights to all other markets in the world, notably including the U.S., Europe and Japan. The company intends to reach out with these Phase III data to potential development and commercialization partners for major markets not licensed to Orient Pharma.

Update on 2Q17 Financials

On Aug 8, 2017, DURECT Corporation (DRRX) announced financial results for the three months ended June 30, 2017.

Total revenues were $4.3 million for the three months ended June 30, 2017 as compared to total revenues of $3.2 million for the three months ended June 30,2016, an increase of 37%.

Product sales for 2Q17 were $3.1 million, compared to $2.8 million for the same period of 2016, an increase of 9.5%.

Collaborative R&D revenue was $1.3 million for 2Q17, compared to $0.4 million for 2Q16.

COGS for 2Q17 was $0.9 million, compared to $0.9 million for 2Q16.

R&D expenses for 2Q17 were $9.1 million, compared to $7.9 million for 2Q16.

SG&A expenses for 2Q17 were $3.7 million, compared to $2.9 million for 2Q16.

Net loss for the second quarter of 2017 was $9.9 million, as compared a net loss of 9.0 million for the second quarter of 2016.

As of June 30, 2017, cash and investments were $33.6 million. Debt at June 30, 2017 was $19.9 million.

In July 2016, Durect refinanced its existing $20 million term loan with Oxford Finance into a new term loan that results in an extended maturity (to four years) and an extended interest only period (to 18 months).

Attractive Valuation

We continue to be optimistic about Durect story even with the failure of POSIMIR® program. We adjusted our price target to $6.00 from previous $7:00 per share due to the failure of POSIMIR program.

Durect is a late development stage biotech company with a Phase III candidate Remoxy. Although Remoxy received a CRL from the FDA, we still believe this is a viable program and will be approved in 2019.

Based on our financial model, we expect the company will break even in 2020 with based on total revenue of $77 million, which include royalty revenue from Remoxy, existing product sales and collaborative revenue.

As we discussed above, among the company's multiple candidates, we are especially optimistic about the company's epigenetic regulator program **DUR-928**, which holds great potential for multiple indications, such as NASH and acute kidney injury.

We believe even with the only NAFLD/NASH indication, the market is big enough for DUR-928 to support the company's long term growth and valuation. If we look at the valuation of similar companies, we will have some sense how DUR-928 will impact Durect's valuation. We notice that three companies have similar NASH programs. ICPT and RPTP's NASH programs are in Phase II and FGEN's is in Phase I/II. Our $6.00 per share values the company at $882 million in market cap based on 142 million outstanding shares, which is still conservative compared to its peers in our view.

If the company can show positive DUR-928 data for NASH and/or acute kidney injury in the planned Phase II trials, share price can easily double.

Company	*Ticker*	*NASH stage*	*Current Share Price*	*Market Cap ($million)*
Intercept Pharmaceutical	ICPT	Phase II	$115.00	$2,860.00
FibroGen	FGEN	Phase I/II	$41.50	$2,959.00
Raptor Pharmaceuticals	RPTP	Phase II	$9.00	$770.00
Average			**$55.17**	**$2,196.33**
DURECT Corporation	DRRX	Phase I/II	$0.82	$121.00

HISTORICAL STOCK PRICE

DISCLOSURES

The following disclosures relate to relationships between Zacks Small-Cap Research ("Zacks SCR"), a division of Zacks Investment Research ("ZIR"), and the issuers covered by the Zacks SCR Analysts in the Small-Cap Universe.

ANALYST DISCLOSURES

I, Grant Zeng, hereby certify that the view expressed in this research report accurately reflect my personal views about the subject securities and issuers. I also certify that no part of my compensation was, is, or will be, directly or indirectly, related to the recommendations or views expressed in this research report. I believe the information used for the creation of this report has been obtained from sources I considered to be reliable, but I can neither guarantee nor represent the completeness or accuracy of the information herewith. Such information and the opinions expressed are subject to change without notice.

INVESTMENT BANKING AND FEES FOR SERVICES

Zacks SCR does not provide investment banking services nor has it received compensation for investment banking services from the issuers of the securities covered in this report or article.
Zacks SCR has received compensation from the issuer directly or from an investor relations consulting firm engaged by the issuer for providing non-investment banking services to this issuer and expects to receive additional compensation for such non-investment banking services provided to this issuer. The non-investment banking services provided to the issuer includes the preparation of this report, investor relations services, investment software, financial database analysis, organization of non-deal road shows, and attendance fees for conferences sponsored or co-sponsored by Zacks SCR. The fees for these services vary on a per-client basis and are subject to the number and types of services contracted. Fees typically range between ten thousand and fifty thousand dollars per annum. Details of fees paid by this issuer are available upon request.

POLICY DISCLOSURES

© Copyright 2017, Zacks Investment Research. All Rights Reserved.

This report provides an objective valuation of the issuer today and expected valuations of the issuer at various future dates based on applying standard investment valuation methodologies to the revenue and EPS forecasts made by the SCR Analyst of the issuer's business.
SCR Analysts are restricted from holding or trading securities in the issuers that they cover. ZIR and Zacks SCR do not make a market in any security followed by SCR nor do they act as dealers in these securities. Each Zacks SCR Analyst has full discretion over the valuation of the issuer included in this report based on his or her own due diligence. SCR Analysts are paid based on the number of companies they cover. SCR Analyst compensation is not, was not, nor will be, directly or indirectly, related to the specific valuations or views expressed in any report or article.

ADDITIONAL INFORMATION

Additional information is available upon request. Zacks SCR reports and articles are based on data obtained from sources that it believes to be reliable, but are not guaranteed to be accurate nor do they purport to be complete. Because of individual financial or investment objectives and/or financial circumstances, this report or article should not be construed as advice designed to meet the particular investment needs of any investor. Investing involves risk. Any opinions expressed by Zacks SCR Analysts are subject to change without notice. Reports or articles or tweets are not to be construed as an offer or solicitation of an offer to buy or sell the securities herein mentioned.
