Marrone Bio Innovations, Inc. (MBII-NASDAQ)

Restructured capitalization of warrants reduces potential dilution. Marrone Bio reaffirms path to positive cash flow.

Biopesticides are the highest growth segment in the agricultural business. Existing products and new technologies awaiting approval are expected to drive earnings into profitable territory within four years.

OUTLOOK

Marrone Bio Innovations is the only pure play in the growing biopesticide arena. The company has a large patent portfolio that should generate new products and product extensions over at least the next five years. The R&D is focused on the largest market segments. The existing market of chemical pesticides is expected to give way to more ecologically sound biopesticides especially within the fruit and vegetable segment for both organic and conventional growers.

RECENT NEWS

Following the recent Form S-1 registration of stock and warrants (outlined below) the major stockholders and Marrone Bio Innovations have signed a warrant exchange agreement.

Under the agreement 46 million existing warrants will be swapped for 29.9 million new warrants with various expiration dates and an exercise price of $0.75 a share. If all the warrants were to be exercised it would generate about $14.4 million in 2020 and $8.1 in 2020 for $22.4 million in total. The net impact would also be a 79% reduction in warrants outstanding by the end of 2020 and close to a complete elimination, either by exercise or expiration, of all the warrants by the end of 2021.

The first tranche was exercised effective May 01, 2020 for $2.5 million.

Marrone Bio Innovations management expect full exercise of all the warrants to take the company to cash flow breakeven (EBITDA) by the end of 2021.

The company's new plant health product, Pacesetter, received EPA approval in February, 2020 and state approval in the major corn, soybean and wheat states is expected before the growing season. Fungicide application months are usually Jun/July for Corn; May/June for Soybean and May/June for wheat. Products are purchased about a month in advance and are applied to the leaves by both ground and aerial spraying of water based suspensions at application rates of between 6 and 12 ounces per acre.

In the United States the "normal" (depending on rain, snow and heat conditions at the time of planting) acres under cultivation are 80 million acres under corn;75 million under soybeans and 62 million under wheat (USDA data) but there is significant variability in reported data from various sources and acres planted each year depend on prior year prices, current prices, the export market, current inventory and many other factors.

Pacesetter has been used within the BioUnite portfolio in conjunction with chemical fungicides. It promotes root growth and increases chlorophyll (the green in leaves) production as compared to the growers standard fungicide program. The cost of Pacesetter on corn is about $5 an acre. A normal improvement in yield is about 4 bushels an acre. At this time corn is selling for $3.25 a Bu (it peaked in price at $8.30 a Bu in 2012), average yield is about 175 Bu/acre so the monetary gain to the farmer is $13.12 an acre at a cost of $5.00. At a 25% penetration this would be a $100 million revenue generator to Marrone on corn alone. A 10% market penetration of the three crops would be over $100 million.

Marrone Bio Innovations product, Jet-Oxide 15% Sanitizer, is now allowed by the U.S. EPA for use against the human coronaviruses on hard surfaces in the food industry. It has also been used on vegetables and fruit. It can also be used during storage to prevent contamination.

The company also has a product, Jet Ag that is used for the direct treatment of fruit and vegetables.

Jet Oxide has been approved for use on hard surfaces such as metal, plastics and glass in the food and agricultural industries where a virus could live for several days. It has been used on equipment and machinery used in the food processing industries. It was found to be effective against SARs.

A Form S-1 registration statement has been filed for the 152,641,473 shares for existing shareholders, many of which were early investors. Registration was required by securities law to comply with agreements signed in 2017 and 2019 regarding the conversion of warrants into common stock.

Marrone Bio is not selling shares, nor will it receive any proceeds from the sales of these shares. There is no change in the fully diluted share count or the number of basic shares used for calculating the earnings per share. However, conversion of the warrants into shares will generate positive cash flow to the company.

The company reported revenue below our expectations but gross margins reached a new fourth quarter record. As Marrone gains more experience in biologics production gross margins could continue to increase.

The company expects an increase in the growth rate in 2020 and possibly in 2021. The seed treatment segment has grown exponentially and is now about one third of revenue. BioUnite has proved to be a very viable concept and mixing Marrone's bio products with conventional chemical products has shown that there is a synergistic effect with crop yield improvements that exceed those from either treatment alone.

Both of the acquisitions made last year are making a positive impact. Pro Farm had a small positive impact on profits in the 4Q19 and this should also increase gross margins.

Hemp continues to be a crop of significant interest. However some states seem to be determined to kill the goose before it has a chance to lay any golden eggs. Some experts postulate that hemp could become a major crop as important as cotton and wheat.

Due to the very wet planting season in the corn belt in 2019 acres planted declined for corn and soy beans. This year the acres planted should recover leading to an increase in demand for pesticides. Given that Marrone Bio Innovations' products are becoming more main stream and are accepted in more areas we expect the combination of new products and increased cultivation to drive revenue higher.

We have increased our revenue estimates for 2020 and beyond, with improving gross margins and this should drive the company closer to profitability.

Stargus, one of Marrone Bios fungicides, has been approved for immediate use in California for use on several crops, including grapes, vegetables and strawberries. Stargus can be applied right up the time of harvesting and it is very effective when combined with traditional pesticides.

The state of California is the largest grower of vegetables in the US, with close to a 40% market share, followed by Florida with 6%. Florida is the largest producer of fresh cucumbers and Michigan is the largest producer of pickled cucumbers so California is a very important market for Marrone Bio.

The company is extending its registration processes to countries outside of N. America. The recent acquisition of Pro Farm (Finland) makes Europe a logical area for expansion by piggy-backing on Pro Farms existing sales and marketing staff.

Marrone Bio Innovations has increased its line of credit based on accounts receivable from $7 million to $20 million and has added a line of credit backed by its inventory. Both additional funds will be made available from LSQ Funding Group [https://lsq.com]

Small high growth companies frequently our pace their cash as they try to balance cash/accounts receivable/inventories/accounts payable with operating expenses. This is especially difficult when revenue is highly seasonal and costs occur in different accounting periods than accounts receivable are paid.

Lending organizations have a lot more access to the financials than do analysts so it is encouraging that LSQ Funding has such confidence in Marrone Bio Innovations to guarantee access to $18 million of additional funding

Our estimates do not include any data from the recent acquisitions since no current or historical data is available at this time. When the impact of the acquisitions becomes available we will adjust our forecasts accordingly.

Marrone Bio Innovations has received EPA approval for the use of Stargus and Regalia on both indoor and outdoor hemp plants. The company is actively pursuing state approval to add hemp treatment to the current label and expects to receive these in time for the cannabis growing season.

All of the fungicides that infect cannabis plants are treatable by the two fungicides and Marrone Bio Innovations has products the protect cannabis from other pesticides.

On April 16, 2018 Marrone Bio Innovations announced that Regalia had been approved for control of powdery mildew on Cannabis by Colorado; Oregon; Nevada Washington State and other states where cannabis can be legally grown. The potential opportunity for treating organic hemp for the production of CBD in California could be a significant boost to the company's growth in 2021. Hemp is a major crop worldwide with the main uses as a fibre and a source of seeds for human consumption. China is the largest producer of hemp and hemp products.

Marrone discussed its current position on cannabis in California on Jan. 18, 2019. The California Dept. of Pesticide, CDP, has confirmed that the use of Grandevo CG is consistent with Food and Agriculture code 12973 in that such use would not conflict with registered labeling for Regalia and Grandevo.

In the United States the use of CBD oils has exploded over the past three years, from less than $100 million in 2016 to an estimated $500 million in 2019. Now that hemp products are legal at the Federal level (but not yet legal for FDA legislation) and in most states we expect its growth to accelerate.

Field trials of a next generation nematicide/insecticide, designated MBI--306, derived from a soil bacterium discovered by Marrone Bio Innovations showed superior control of insects and nematodes in corn.

Corn is the world's most important grain, based on production volume. In 2016/2017, a production level of around 1.07 billion metric tons of corn was achieved. In that year the United States was by far the biggest corn producer worldwide, with a production volume amounting to over 388 million metric tons. This corresponded to over one third of the global corn production. The leading U.S. states in corn cultivation are Iowa, Illinois, and Nebraska. [https://www.statista.com/topics/986/corn/] Only wheat matches corn with wheat being grown over a larger area than corn.

The six trials matched MBI-306 against Majestene (a Marrone Bio product) and current chemical treatments. MBI-306 demonstrated a yield improvement as application rates increased when compared to commercial standards.

The product is in the final phase of R&D and will be submitted for regulatory approval in 2020. Depending on the EPA timeline MBI-306 could enter the market in late 2020 but more probably in 2021.

Marrone Bio Innovations has reported the results of international trials of MBI-203WDG on corn which reduced nematode count and increased yield. Untreated yield per acre was just over 128 bushels (Bu) and treatment with MBI-203 increased the yield to 135 Bu. This was better than the conventional treatments. Root damaged was cut in half but was slightly above that when a conventional chemical nematicide was used. The best yield was obtained when MBI-206 EP was used at a higher dosage.

Stress tolerance trials in Latin America using Pro Farms (Marrone's recent acquisition) Foramin nutrient technology on barley and wheat resulted in higher yields (in kilogram per hectare) when Foramin was included with the current seed treatment. Yield improvement was an increase from about 7340 kg/ha to close to 7820 kg/ha with barley and similar gains for wheat.

Yield gains using BioUnite improve the profitability of crops by a significant amount and require no added investment in machinery or labour.

Pamela Marrone, founder and CEO, will retire from Marrone Bio Innovations but remain on the board and will serve as a consultant.

Third quarter revenue was in line with our estimate, $6.97 million actual (including some into the hemp market) versus our $6.80 million estimate.

Gross margins continued to improve year over year (seasonality and changes in crops make sequential quarter numbers meaningless) and we expect this trend to continue.

Operating expenses were affected by several (large) charges $1.4 million for a litigation settlement and $2.7 million for several acquisitions that occurred in the 3Q19. Apart from these operating expenses were $$9.2 million as compared to our estimate of $9.0 million. We expect operating expense to increase to within the band of $10 million to $12 million a quarter in 2020.

The acquisitions had minimal impact in the third quarter but should have a modest impact in 4Q19.

The company issued, and discussed in the conference call the progress of its new MBI-014 (granular) and its companion MB-015 (liquid) bioherbicides. This is a broad leaf systemic herbicides that is effective against many weeds that have become resistant to such products as glyphosphate (RoundUp). A patents has been issued on the basic microorganism. MBI-115 was found to be very effective against Palmer amaranth, a member of the pigweed family.

The necessary regulatory submissions are being filed for the two bioherbicides and product approval is possible in 2020 with marketing and sale in 2021.

We have adjusted our estimates to reflect the new level operation expenses and the increased share count.

The company has received approval for the use of Stargus in Mexico. This joins Grandevo and Venerate in the arsenal of biological controls available for the BioUnite treatments of various pests. Stargus is aimed at downy mildew, late blight and various other fungi on cucurbits and potato crops. **Stargus will be marketed** through Agri-Estrella, S. de R.L. de C.V**. based in Chihuahua Mexico,** a significant presence with many offices spread all over Mexico. It has over 330 employees and offers a broad range of pesticides from most of the large chemical pesticide makers.

The next growing season will be early 2020 with harvesting in mid 2020. Mexico supplies a significant amount of produce for the N. American market.

Marrone has completed the acquisition of Pro Farm Technologies, a company with which they had previously signed an agreement to collaborate on the use of each other's products.

Pro Farm has developed plant nutrients based on lignins that are a secondary byproducts of paper production. Using these organic polymers, together with other materials such as fulvic acid (a product of humus decomposition), to form molecular bonds with trace elements essential for plant growth, Pro Farm has developed seed treatments and foliar (leaf) treatments that are compatible with Marrone's stable of pesticides.

The cost is $6.2 million in cash, 12.7 shares of common stock and earn outs of up to $7.5 million. No financials for Pro Farm are available but the acquisition is expected to be accretive to revenue and earnings in 2020.

Pro Farm and Corteva Agriscience had announced a commercial agreement in Europe to commercialize Pro Farm's seed treatments. Products for maize (corn), sunflower and rape oil (Canola oil; used extensively for the production of bio diesel in Europe) will be launched in the next growing season targeted at over 2.4701 million acres.

Other product acquisitions include those of Jet Ag and Jet Oxide, a line of disinfectants based on the strong oxidizing agent, peracetic acid. This is commonly used in greenhouses and irrigation systems and for the treatment of plants in post harvest markets. The cost was $2.5 million.

Marrone Bio has announced a new financing that allows **Marrone** to convert existing warrants to equity as long as the stock price is over $1 a share. There are 41.7 million warrants with an exercise price of $1.00.

Ten million dollars worth is being converted and the number of shares outstanding will increase. There will be $26.6 million available from warrant conversion of existing warrants if it is needed. Warrant holders can convert their holdings if they wish to.

There are other warrants with varying conversion prices but, in our opinion, the company will not need to convert them since operations should be at least cash flow positive before all of the $26.6 million would be needed.

Part of the cash raised will be used to provide working capital to the recently announced acquisition, Pro Farm.

There have been several agreements signed by MBII, as mentioned below. Each agreements addresses a separate need within the areas of pesticide treatment.

Pro Farm is strong in seed treatments and gross margins are high. Compass Minerals (CMP $51.32) strengths are in soil treatments and Valagro is strong in leaf treatments. As a result Marrone Bio Innovations has access to a "stack" of treatments within its BioUnite concept.

Pro Farm also expands the geographical reach of Marrone since Pro Farm is strong in Europe. However, products have to registered in each country and this takes time.

Second quarter results were a record second quarter revenue of $7 million and gross margins expanded to a new high of 54.4%. Since the quarters vary in the pesticide applications between raw crops and specialty crops and between what pests are treated. As the operations move from what pests are treated so margins will vary. We anticipate margin changes within the high 40s and low 50s to occur in future quarters. .

We have adjusted our forecasts to include the increase in shares outstanding, 134 million at year end. We have not included any contribution from Pro Farm since historical financials are not available. We expect some financials will be released in an 8K when the acquisition is complete.

MBII has entered into an agreement with Valagro S.p.A. [Spain] to collaborate on R&D efforts to integrate parts of Marrone's extensive microorganism library with Valagro's biostimulation (enhanced fertilizers) products. This is similar to the recently announced collaboration with Compass Minerals (CMPN) {NYSE; CMP $53.03}.

Such agreements are a significant way of broadening a company's potential market and providing platforms not otherwise available.

Marrone Bio Innovations has published the results of extensive successive applications of Haven; Venerate XC, Grandevo WDG and Stargus (this is not registered for use in California) on Almonds and Grapes in conjunction with existing pesticides within the BioUnite concept.

Farmers are now on their second and, in some cases, their third application of Venerate XC plus a chemical pesticide on almonds to control navel orangeworm. Venerate XC mixtures are also being used to combat mites on almonds.

Grandevo WDG added to conventional insecticides is also proving to have a synergistic effect on the efficiency of these insecticides.

The use of Haven and Venerate XC on grapes have increased the sugar (Brix) content of grapes in multiple trials with successive applications 14 days apart but the results vary geographically.

On June 25, 2019 Marrone Bio Innovations received notice that the major claims covering composition and method of manufacture of Grandevo WDG have been allowed.

This means that the patent covering these claims will be issued will be issued in the near future. The family of Grandevo products are an important source of revenue.

This bioinsecticide/miticide kills a large number of sucking pests on a wide variety of crops. The product can be sprayed up to the time of harvesting and there are no toxicity or residue problems.

Crop protection data for 2018 are now available. The overall market increased from $54.3 billion in 2017 to $57.6, fungicides and insecticides comprised a $ billion in 2018. This is an increase of 6.0%, well above the long term forecast of 3% a year for 2018 to 2023.

The best performing geographical area was Latin America which increased by 11.1% to $14.18 billion; USA/Canada/Mexico grew to $11.62 billion, up 8%; Africa/Middle East gained 7.4% to $2.27 billion and Asia/Pacific was up 7.2% to $17.49 billion. The lone decliner was Europe which dropped by 3% to $12.00 billion.

Marrone has interests in Mexico and is working to further relationships in Latin America.

Within the overall markets herbicides accounted for 42.7% of the overall market, fungicides were 28.4% and insecticides 23.3%. Together fungicides and insecticides, the major markets for Marrone's current products, were a $30 billion market.

Marrone Bio has formed a collaboration with Compass Minerals Plant Nutrition [CMPN] to develop new plant nutrition products (enhanced fertilizers) that are combined with microorganism that promote the absorption of nutrients in a more efficient manner.

Marrone Bio will provide access to its comprehensive library of 18,000 microorganisms and CMPN will apply its knowledge of plant nutrition to develop novel systems that promote plant development and increased crop yields.

There are many bacteria and fungi in soil that are known to improve the take-up of plant nutrients and increase root health. Marrone has a significant level of expertise in finding and developing soil microorganisms.

https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5610682/

https://www.holganix.com/blog/5-types-of-soil-microbes-and-what-they-do-for-plants/

Compass Minerals Plant Nutrition is a division of Compass Minerals International Inc. {NYSE: CMP $54.91}. The company has three divisions and operates primarily in the United States, Canada Brazil and the United Kingdom. 2018 revenue was close to $1.5 billion.

Building on the momentum of the last half of 2018 and adding new lines of business in 2019 Marrone Bio Innovations reported record revenue in 1Q19 of $8.6 million (up 103.6%) with 57.2% gross margins.

Both seed/soil treatments and almond tree blossom treatment made a significant contribution to revenue and gross margins in the quarter. Grandevo (for insects and mites) also grew from last year's base.

The addition of new crops will impact the seasonality of revenue, adding to the 2Q19 and 3Q19 revenue. The product mix had a positive impact on gross margins which we expect to return to the 50% area in the 2Q19 and 3Q19.

Marrone will begin using its internal manufacturing capacity to make Venerate in the second half of 2019. This should have a positive impact on gross profit margins since Venerate is one of Marrone's best selling products.

The balance sheet is in good shape with $15 million in cash, including the $1.6 in restricted cash.

We have increased our revenue forecasts for the next four years.

Marrone Bio Innovations has released the results of a 2018 study the company did in collaboration with large almond growers on the impact of ***Venerate*® *XC*** and **Grandevo® WDG** on almond pests.

The addition of ***Venerate*® *XC*** reduced the total nut damage due to navel orangeworm, *Amyelois transitella,* by an additional two percent. It is estimated that this pest may cause a reduction in crop yield of an estimated $1,700 per acre. This pest has developed a resistance to a number of conventional chemical pesticides.

Other almond pests, such as the peach twig borer and the two-spotted spider mite, sprayed when the trees are flowering (February and March) were controlled by the use of **Grandevo® WDG** without affecting beneficial insects. Bees are an essential part of pollination and nut formation.

Almonds are a California crop. Over the past few years close to a million acres of fruit bearing trees produced about 2,300 million pounds of almonds worth $5.6 billion at current prices.

A 1% improvement in yield is worth $56 million to the growers.

Regalia Maxx is now on sale in Western Canada through TerraLink Horticulture, Inc.

TerraLink, based in Abbotsford, British Columbia, Canada is the leading manufacturer and distributor of fertilizer, seed, and crop protection products in British Columbia. It offers a full range of products, including Regalia Maxx, for farmers and professional growers including greenhouse equipment.

Regalia Maxx is currently listed for sale and is listed as organic certified.

Marrone Bio Innovations has announced that Regalia Maxx has received label approval from Canada's Pest Management Regulatory Agency for use on marijuana (Canadian: marihuana) crops in Canada.

A new distributor, Plant Products Inc., has Regalia Maxx listed on its web site as Item # 21137 available in 5L containers. Plant Products Inc . has distribution rights for Eastern and Central Canada and a distributor for Western Canada is expected to be announced in the near future.

Plant Products Inc., with HQ in Leamington, Ontario, is 75 year old full service supplier of products to the greenhouse and horticulture industry in Canada and the USA.

According to the Vineland Research and Innovation Centre biocontrol use in Canada has increased from 69% in 2014 to 92% of the growers in the survey. The number of growers using biocontrol in their integrated pest management has increased from 30% to 70 from 2014 to 2018. Growers have reduced their spending of conventional pesticides over this period.

Regalia is a fungicide that is very effective against powdery mildew, a major pest in marijuana plants. Another major pest in greenhouse cultivation is spider mites and MBI's Venerate product combats this pest. Venerate is registered in Mexico but not Canada.

Za cks Small Cap. Research has initiated coverage on Marrone Bio Innovations with a $2.00 price target.

Fourth quarter revenue was ahead of projections due to better than expected sales of Venerate.

In Dec. 2018 Marrone launched TerraConnect, a new biological soil applied and seed treatment platform delivering high performance products with a broad range of tools to improve and protect crops. TerraConnect is a tailored solution that unites biology and chemistry to protect plants and improve yields.

Expanded international distribution network. Added Vietnam, Cambodia, Turkey, South Korea.

KEY POINTS

Founded by Dr. Pamela Marrone Ph.D. in 2006 Marrone Bio Innovations is the only pure play in the biopesticide arena. All the others are either subsidiaries of large agricultural companies or are small and privately owned. Dr. Marrone was the founder of AgraQuest Inc. (acquired by Bayer) and a founding president of Entotech, Inc.

It is estimated that the potential loss of worldwide crop production without the use of pesticides could be as much as 37% in dollar terms. The use of pesticides reduces the loss to about 14%. Pesticides are essential on a worldwide basis.

Bio pesticides are derived from naturally occurring substances, compounds and microorganisms and are not based on synthetic chemicals.

The company is focused primarily in the bio-fungicide, bio-insecticide and plant stimulant markets, plus a new entrant in molluscicide treatment. It is not involved in the fertilizer segment. All products are competitive in price and efficacy.

Trends are towards increased cultivation of organic qualified crops. All of MBII's current products are certified for organic food production.

The phase-out of current chemical pesticides due to health concerns and potential damage to the environment opens the door to new, more selective, biopesticides. The company's products are environmentally friendly.

Many chemical pesticides cause pest resistance which does not occur with biopesticides.

The company has a strong, and patent protected, series of products that have been introduced over the last ten years, with most of them being relatively new. This slate of products is now in the third stage of market introduction and is expected to add to the already impressive revenue growth. There is also a series of new products that will be introduced over the next few years.

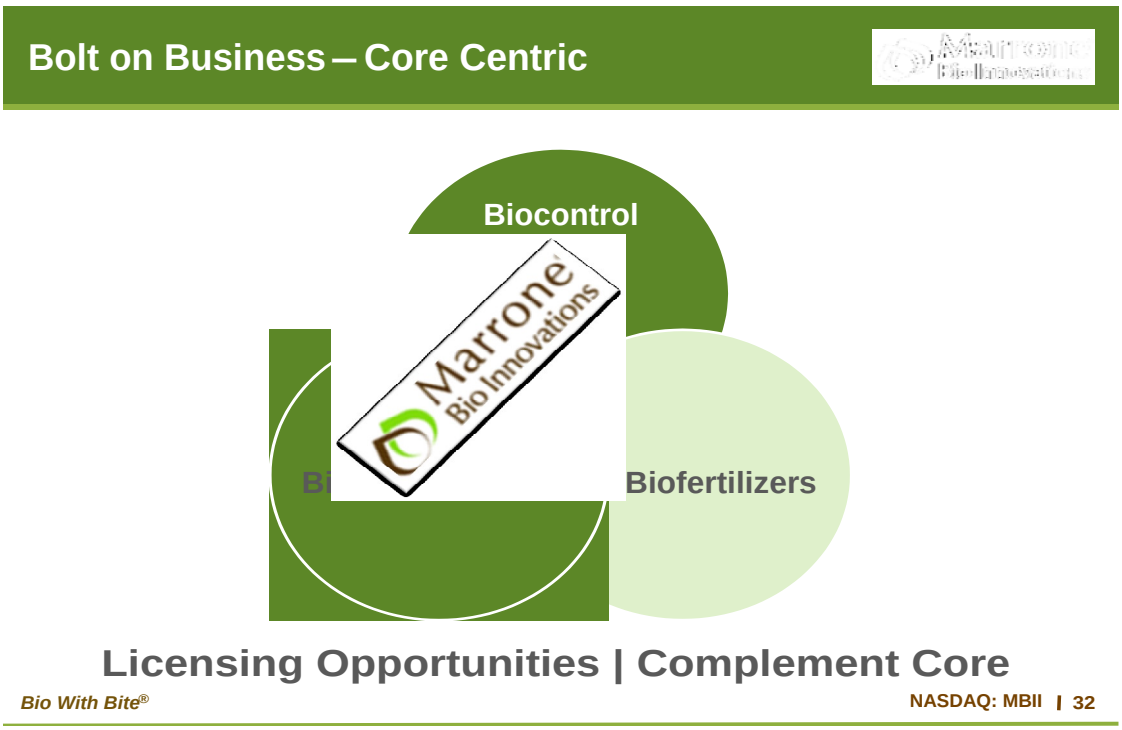

Marrone has 35 U.S. and 199 foreign patents with 31 U.S. and 146 foreign patents pending. These cover the proprietary microorganisms, the compounds produced by these organisms, novel mixtures of compounds and the use of these compounds and mixtures in treating pests.

Marrone Bio Innovations has Vertically Integrating Manufacturing facilities in Bangor MI [just north of I94 and east of Lake Michigan]. It has three 20,000L fermentation tanks for a total of 15,582 US

gallons, mixing tanks, centrifuges that are currently used for the production of Regalia, Grandevo and Zequanox. The facility is scalable and Majestene and Venerate capacity will be added as needed. Contracted capacity adds 50,000L as needed.

BIO-UNITE strategy The combination of the power of biology and the performance of chemistry.

It has been shown that the combination of biological products and chemical pesticides are more effective than either treatment alone.

For example adding Regalia Rx to the current fungicide treatments on corn significantly increases the yield. Traditional insecticide treatments for navel orangeworms on almonds was much improved when Venerate XC was included in the current commercial standard treatment.

According to Dan Custis, CEO of Advanced Biological Marketing (ABM) on March 1, 2019:

In the row crop world, the majority of biopesticide deployments are going out alongside, not in place of, traditional crop protection chemistries.

Year	Product	Function	Major pests	Major use/market	Inter-
					national
2008	**Regalia**	**Fungicide**	powdery mildew	Almonds, Grapes, Cannabis	world wide
2011	**Grandevo**	**Insecticide**	mites, thrips	Fruit, vegatables, Cannabis	Mexico
2016	**Venerate**	**Insecticide**	mites, thrips aphids	Fruit, nuts, cannabis	Mexico
2016	**Majestene**	**Nematicide**	Plant parasitc nematodes	Corn,soybeans, cotton	in progress
2018	**Zelto**	**Nematicide**	parasitic nematodes	Turf, golf courses	N
2017	**Haven**	**Stimulant**	excess sunlight & heat stress	Almonds, citrus	Canada
2017	**Stargus**	**Fungicide**	downy mildew, white mold	Grapes, apples. Strawberries	Canada
2017	**Amplitude**	**Fungicide**	white mold , soil diseases	Beans, dried beans (pulse crops)	Canada
2018	**Zequanox**	**Molluscide**	zebra & quagga mussels	Power plants, industrial plants.	Canada
Near-term introductions:					
	Ennoble	**fumigant**	Soil diseases & nematodes	Strawbwrries, tomatoes potatoes	
	MBI-014	**herbicide**	broad range of weeds	Pigweed in cotton, soybeans	
	Combination products		Next generation multifunctional mixtures.		

Strong Product Portfolio

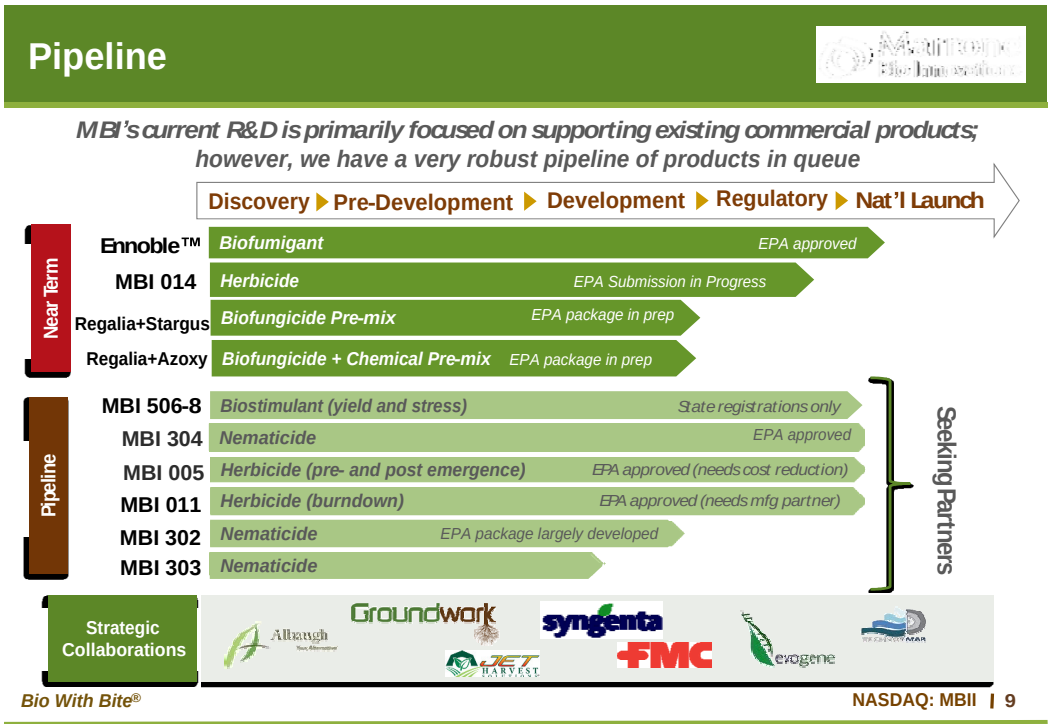

Finding Solutions for Pests, Diseases and Crop Stress

Product	What is it?	Category	What Does it Do?
REGALIA	Knotweed extract	Fungicide Plant health	• Controls **plant diseases** and improves plant health • Strong on **powdery mildew**
STARGUS AMPLITUDE	New strain of *Bacillus* bacteria	Fungicide Plant health	• Controls **plant diseases** and improves plant health • Strong on **downy mildews, white and gray molds**
GRANDEVO	New species of bacteria	Insecticide	• Stops feeding and reproduction of a broad range of **chewing and sucking insects, mites and flies**
VENERATE	New species of bacteria	Insecticide	• Stops development of a broad range of **chewing and sucking insects, mites and flies**
MAJESTENE ZELTO	New species of bacteria	Nematicide	• Controls broad spectrum of root-feeding **nematodes** to increase yields & quality
HAVEN	Coconut oil extract	Crop stress reduction	• **Reduces sun & water stress**, increasing yields & quality
ZEQUANOX	New strain of bacteria	Molluscicide	• Industry's only biological solution **for invasive zebra & quagga mussels**

Bio With Bite® NASDAQ: MBII | 8

It takes about three seasons, with the appropriate climatic conditions, before a product will generate significant revenue. There are field tests, larger scale field trials and finally a season of acceptance by the farmer.

Marrone has several products that are entering this final period. Venerate, which was significant in 4Q18, Majestene and Zelto. Then in 2020 Haven, Stargus and Amplitude kick in. This not to say that these products will not contribute some revenue earlier but the major revenue growth should start in 2020

Until 2018 Regalia was probably the largest seller in Marrone's portfolio of products. It is approved for both conventional and organic crop farming. It is produced from the giant knotweed plant (Reynoutria sachalinensis) a highly invasive weed that grows widely all across Asia. It can grow 6 inches a night.

The product is registered in 16 countries including the US and Canada. Registration is pending in 8 more countries and development is ongoing in at least 10 other countries including China.

Regalia is an effective treatment for powdery mildew and several other diseases and potential markets include almonds, grapes, vegetables, row crops and cannabis.

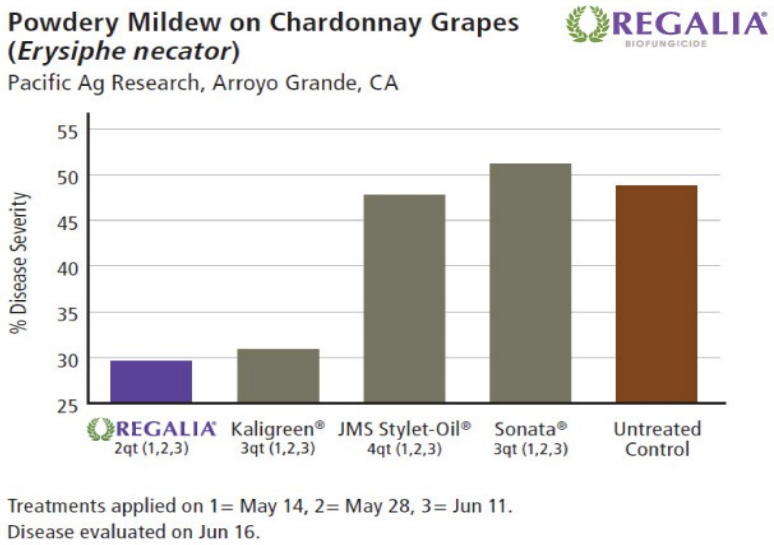

Regalia, which has been improved by several generations since its market introduction, Grandevo and Venerate accounted for 95% of revenue for the 3Q18. However, the seasonality of crop treatments changes the revenue ratios of each product.

The extract is highly effective against powdery mildew. It helps the plant fight the mold rather than attacking the mold directly. When treated with Regalia the plant immune system is stimulated to protect the plant from the attacking disease. Research has proven that the plants produce higher levels of certain proteins and other compounds that inhibit both fungal and bacterial growth.

Marrone has a significant Chinese supplier that acquires the raw plant from numerous suppliers and then extracts the active ingredient with ethyl alcohol and dries the raw material (similar to the procedure used to produce Stevia, a well known sweetener) before shipping it to Marrone Bio Innovations. Marrone keeps an inventory of up to a year's supply to offset any dislocations in the supply chain.

Almonds are a major crop, with most of the production of over 400 million pounds from over 800,000 acres centered in N. California. 100% of domestic almond production is in California, which is also almost 80% of worldwide production. Regalia is effective against powdery mildew; Brown Rot Blossom Blight and Coryneum Shot Hole, which are major pests. Many fungicides have induced resistance in pests on almonds, but Regalia has shown a low risk to the trees developing resistance.

Another important crop is grapes, which can be infected by powdery mildew.

https://marronebioinnovations.com/ag-products/brand/

Powdery mildew is a major problem in the cultivation of cannabis. Cultivation and transport of hemp is now legal under the Farm Act of 2018. In 2018 hemp was grown in 23 states and on 78,176 acres, up from 25,713 acres in 2017 (this excludes marijuana grown under state regulations). The three largest states were Montana (22,000 acres); Colorado (21,578 acres) and Oregon (7,808 acres).

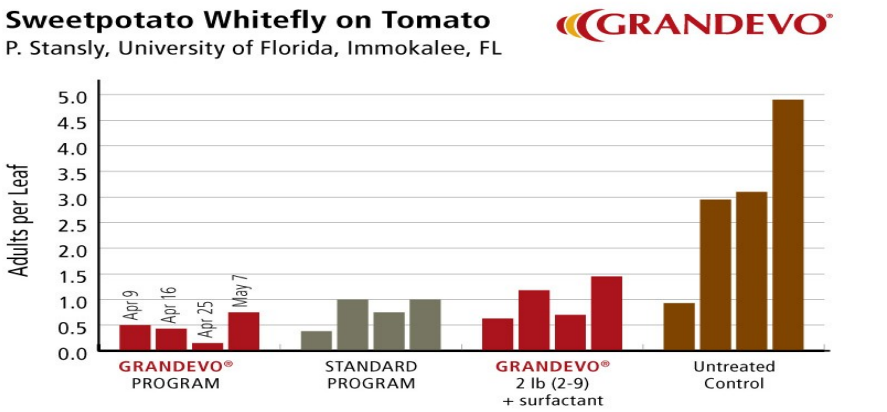

Hemp can be used as a legal supply of CBD (cannabidiol). China dominates the international market for such things as hemp industrial fiber and hemp seed. However, cultivation for CBD requires different methods than cultivation for industrial use and can generate over $60,000 per acre to the farmer.

Pesticide residue is a major problem for cannabis and its derived products. Recent tests in California (San Diego Union Tribune 03/03/2019) discussed the problem. Out of 35,038 samples tested, 3% failed due to the presence of pesticides. This was the second reason for failure after mislabeling the cannabinoids content. Biopesticides do not leave a harmful residue.

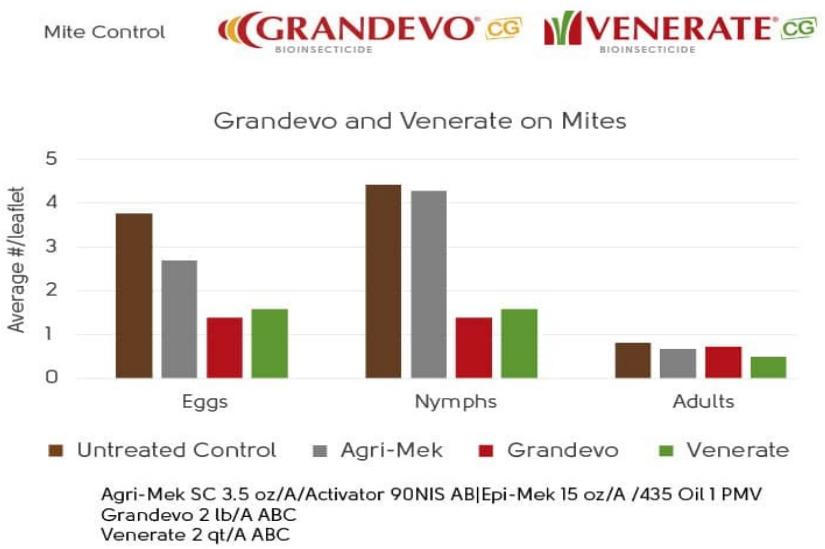

Grandevo® Venerate® and Majestene® are bacterial based pesticides based on adapted versions of earth borne bacteria.

Grandevo is a dead bacteria based on *Chromobacterium (subtsugae)*, one of 11 subspecies of chromobacterium, found in soil. Discovered by the USDA and originally patented by them (US patent 7,244,607 B2) for certain uses as an insecticide. Marrone has patents on the use of the bacteria and associated compounds (fermentation solids) for insect control on corn rootworm, nematodes and several insects and mites.

The bacteria acts as a stomach poison to certain classes of chewing and sucking insects. It is non toxic to humans and is generally benign when applied using spray applications. Its target pests include thrips on strawberries and citrus; whitefly on tomatoes and peppers; spider mites on strawberries (and on cannabis) as well as pests on grapes, peaches and almonds and possibly alfalfa.

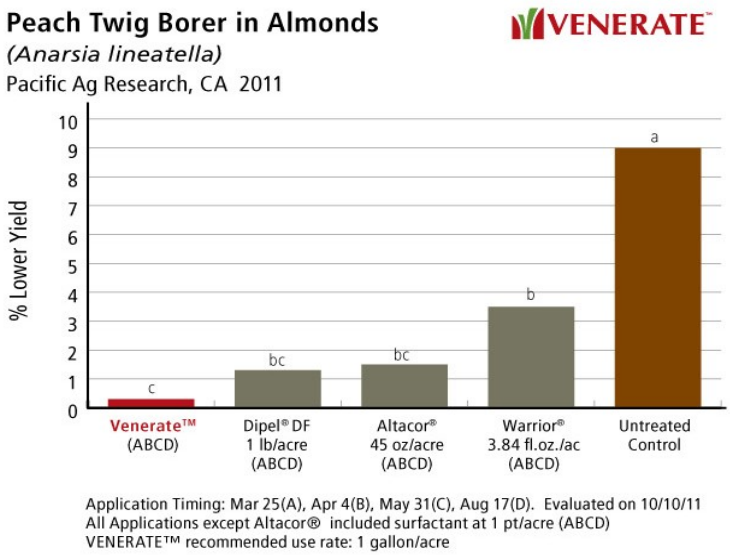

GRANDEVO PROGRAM: Admire® Pro 8.5 fl.oz. (1- soil drench), Grandevo® 2lb + surfactant (4-9), Malathion 32 oz (4), Knack® 10 oz (5), Hero™ 10.3 oz (6,9), Baythroid®XL 2.8 oz (7), Oberon®2 SC 8.5 oz (8)
STANDARD PROGRAM: Admire® Pro 8.5 fl.oz. (1- soil drench), Fulfill 2.75 oz (3), Malathion 32 oz (4), Knack® 10 oz (5), Hero™ 10.3 oz (6,9), Baythroid®XL 2.8 oz (7), Oberon®2 SC 8.5 oz (8)
Treatments applied on 1= Mar 12, 2= Mar 19, 3= Mar 26, 4= Mar 30, 5= Apr 6, 6= Apr 13, 7= Apr 20, 8= Apr 27, 9= May 4, 2012.
Treatment 1 applied at 120 ml/A, treatments 2-7 applied at 40 gpa, treatments 8 and 9 applied at 60 gpa.
Target pest species: *Bemisia tabaci*

It has long been known that members of the family of the bacteria *Burkholderia complex* have insecticidal properties. They are resistant to antibiotics and their associated diseases have such a high mortality rate that pathogenic B.mallei and B.pseudomallei are considered potential biological warfare agents. The agricultural and industrial uses have been severely limited due to their toxicity.

However, Dr. Marrone's R&D team have managed to isolate, and produce, a non pathogenic member of the genus *Burkholderia* which they named as the species of *rinojensis.*

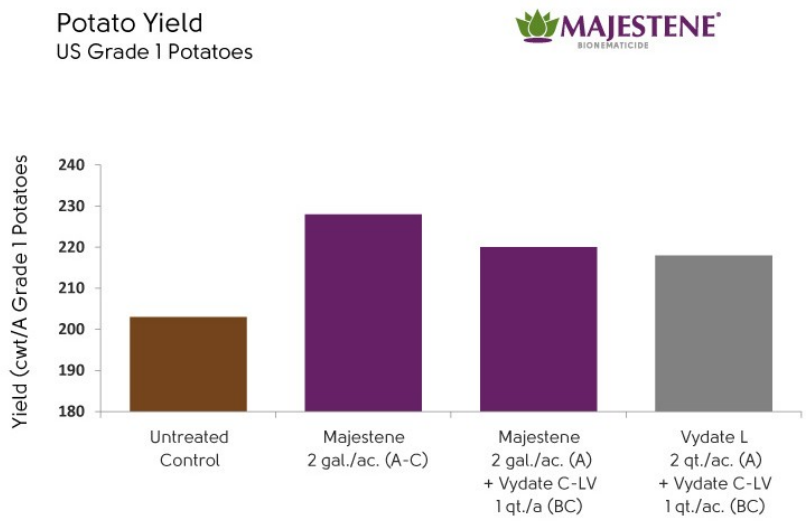

Isolate A396 is the basis for Marrone's Venerate bioinsecticide and Majestene bionematicide.

Venerate is several patented active compounds that are active on contact and by ingestion. It is applied as the killed bacteria in a liquid formulation, registered in the U.S.A. and Mexico and commercial efforts are ongoing in Latin America, Europe, Middle East Africa and Asia.

The formulations have no effect on pollinators but is a broad spectrum insecticide that kills sucking and chewing insects, mites, flies and nematodes. The target pests are essentially the same as for Grandevo.

Majestene is based on the same bacteria as is Venerate, but its applications are based more towards nematodes and seed treatment. There is also a version, Zelto, that is aimed at the domestic and professional turf market.

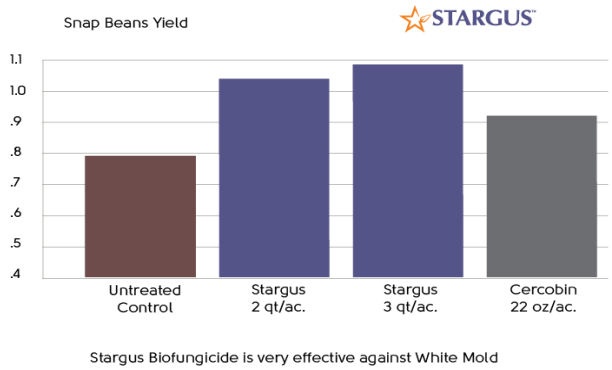

Majestene is as effective as are chemical pesticides in the treatment of soil and seeds.

Stargus® and Amplitude™

Stargus is aimed at specialty crops like leafy vegetables, grapes, apples and fruit, whereas Amplitude is used on row crops, pulse crops [Wikipedia:A **legume** (/□l□□ju□m, lə□□ju□m/) is a plant in the family Fabaceae (or Leguminosae), or the fruit or seed of such a plant (also called a **pulse**], oil seed crops**,** sugar beets.

The primary target is downy mildew, a major plant pathogen that winters in the Southern States and moves north during the spring. Vine crops (grape, hops) and soybeans are very susceptible.

The active ingredient is a new strain of *Bacillus amyloliquefaciens,* F727, a bacterium isolated by MBI scientists from a soil sample in northern California. While this type of *Bacillus* is common in soil, and other biological products contain the same species, MBI's discovery is unique in its high performance on downy mildews, white molds, *Fusarium* and *Botrytis* gray mold, which are particularly difficult to control with both biologicals and chemicals. The bacteria in Stargus work by colonizing plant root hairs, leaves and other plant surfaces, thereby preventing establishment of fungal and bacterial pathogens. The Stargus bacteria also produce natural compounds that inhibit bacterial and fungal growth and spore germination. Further, the bacteria trigger immune responses in the plant to ward off diseases and increase growth and yield, creating a healthier and stronger plant. In Canada, the approved label for Stargus is for the control or suppression of various diseases on cucurbits, legume vegetables, potatoes, grapevines, canola and sunflowers. MBI holds two U.S. patents on the novel strain in the biofungicide product.

Stargus Biofungicide is very effective against White Mold

HAVEN™, a yield and quality enhancer, contains long chain fatty alcohols that, when applied to crops and turf, reduce plant transpiration rates before and during periods of drought stress. Although HAVEN is produced through coconut oil, it can also be made from sperm whale oil. The main ingredient, stearyl alcohol, $CH_3(CH_2)_{16}CH_2OH$, is widely used in cosmetics and lubricants. It is also used as an evaporation suppressant, added to lakes and ponds to reduce evaporation. It is safe and cheap.

Possible markets are Almonds & Pistachios (1,000,000 acres mostly in California, 406000 tonnes of pistachios were produced in the U.S.A. in 2016), grapes (500,000 acres) citrus (100,000 acres), row crops (100 million acres).

Zequanox® molluscicide.

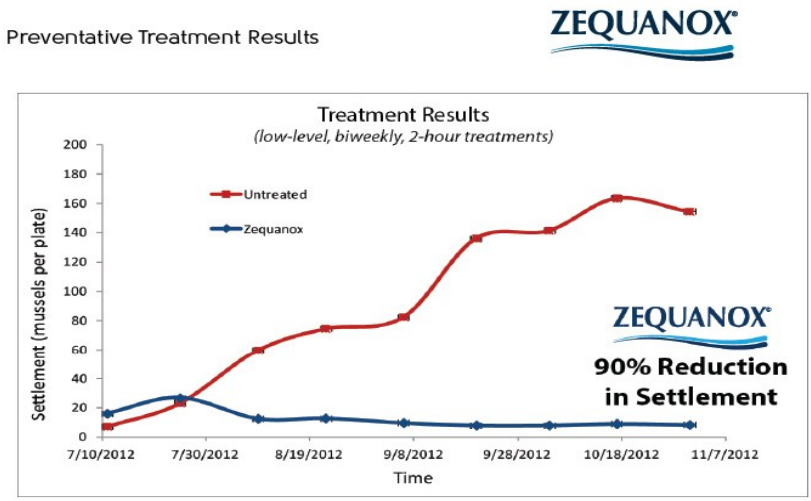

Another result of Marrone Bio Innovations' research is the development of a soil microbe that they found to be an effective control of zebra and quagga mussels. Zequanox does not harm fish or plants.

The active ingredient in Zequanox is composed of dead cells of the soil microbe, *Pseudomonas fluorescens (Pf),* which is ubiquitous in North American freshwaters and soils.

Since their introduction to North America in the mid-1980s, invasive zebra and quagga mussels have been causing significant damage to the ecosystem, to water cooling systems, irrigation water and potable water systems. These tiny mollusks have severely degraded ecosystems, inhibited recreation, and wreaked havoc. It is estimated that the two species cause over $300 million a year in treatment and repair.

Conventional treatment is to use harsh chemicals that themselves cause damage. Marrone has the only non-corrosive safe treatment.

The active ingredient, combined with biological, food grade inert materials, creates a wettable powder end product that has the appearance of freeze-dried coffee. The formulated end product is mixed with on-site water to form a slurry which is then injected into the water system. The invasive mussels respond to the Pf as a food source and will continue to filter feed in the presence of Zequanox, effectively consuming the product along with their regular diet. Once ingested, the product will rupture the stomach lining of the mussels, killing the mussel.

Zequanox is a significant advance in water treatment. It is safe and effective. Moreover the treatment has to be continuously applied to keep the mussels at a safe level. Assuming 10% of the current treatment cost as a reasonable expense to the user, it could generate revenue of $30 million a year to the partnership.

Ennoble™

The first product in the pipeline is the biofumigant Ennoble. It has been EPA approved and should be launched commercially in 2019.

The active ingredient in **Ennoble** is *Muscodor albus,* a naturally occurring endophytic fungus. Marrone screened many *Muscodor* strains to find the best one for development as a reduced-risk biofumigant. *Muscodor albus* SA-13 fits the bill, and testing began in 2014. The company applied for EPA approval in 2015 and received registration in 2016. Marrone expects California approval to follow soon.

Ennoble is non toxic and initial trials showed that it works as well as the leading chemical fumigants.

Seed treatments

Marrone Bio Innovations and Israeli based Ground-work BioAg announced in 2017 the successful field trials of the world's first all-biological comprehensive seed treatment for pest management. The treatments tested in corn and soybeans contained mycorrhizal inoculants from Groundwork, called Rootella®, as well as a bioinsecticide, a bionematicide, and a biofungicide from Marrone.

The two Biological Stack Seed Treatments (BSST) are comprised of two different insecticidal/nematicidal bacteria, one biostimulant/fungicidal bacterium and mycorrhizal fungi. The addition of Groundwork's mycorrhizae appear to enhance these microbes. According to Marrone Bio Innovations CEO Pam Marrone, the project has potential for high impact in the seed treatment market in general across a broad range of crops, and in particular can meet an unaddressed need for the rapidly growing organic grain segment and regions where pest resistance is an issue.

Corn and soybeans were tested in four Midwestern U.S. states. In corn, the two bio-stacked treatments reduced corn rootworm populations and corn lodging, at least as well or better than the commercial chemical standard. BSST Treatment 1 provided an average increase of 10.9 bushels (+5.8%), and BSST Treatment 2 an average increase of 12.5 bushels (+7.2%). Respectively, these improvements were 3 and 7.4 bushels higher than the commercial standard.

In Aug. 2016 MBII signed an agreement and formed a distribution partnership with Albaugh LLC to develop and market a combined insecticide and nematicide. This was followed in May 2016 with an agreement for Albaugh to sell Grandevo and Venerate in Mexico.

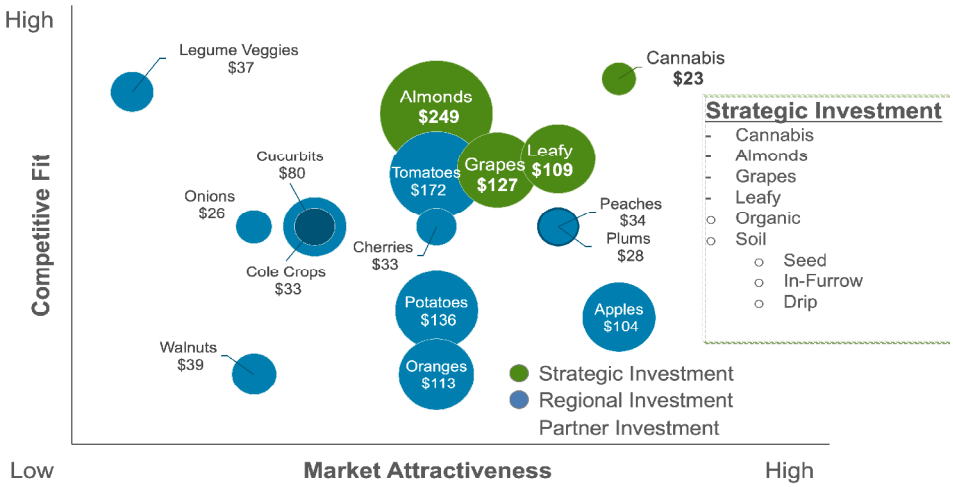

In April 2017 successful field trials of for the world's first all biological seed treatment were completed.

In Dec. 2018 Marrone launched TerraConnect, a new biological soil applied and seed treatment platform delivering high performance products with a broad range of tools to improve and protect crops. TerraConnect is a tailored solution that unites biology and chemistry to protect plants and improve yields.

The seed treatment market is forecast to grow from $6.8 billion in 2017 at an 11% rate.

Marrone Bio Innovations has outlined its potential markets and how attractive each one is for future investments.

The end result of cannabis legislation may be state by state approval of both types of plant, both hemp and marijuana, since recreational use will still be illegal at the federal level. This would lead to regional markets and localized production. The extraction of CBD would occur on a state by state basis. We believe CBD from hemp cannot be distinguished from CBD from any other cannabis plant. The Farm Bill legalized hemp production, that is cannabis with less than 0.3% by volume of THC. MBII is amending its pesticide EPA labels so that they would be allowed for use on hemp.

On April 16, 2018 Marrone Bio Innovations announced that Regalia had been approved for control of powdery mildew on cannabis by Colorado, Oregon, Nevada, and Washington State. It has since been approved in California and most other states where cannabis is allowed

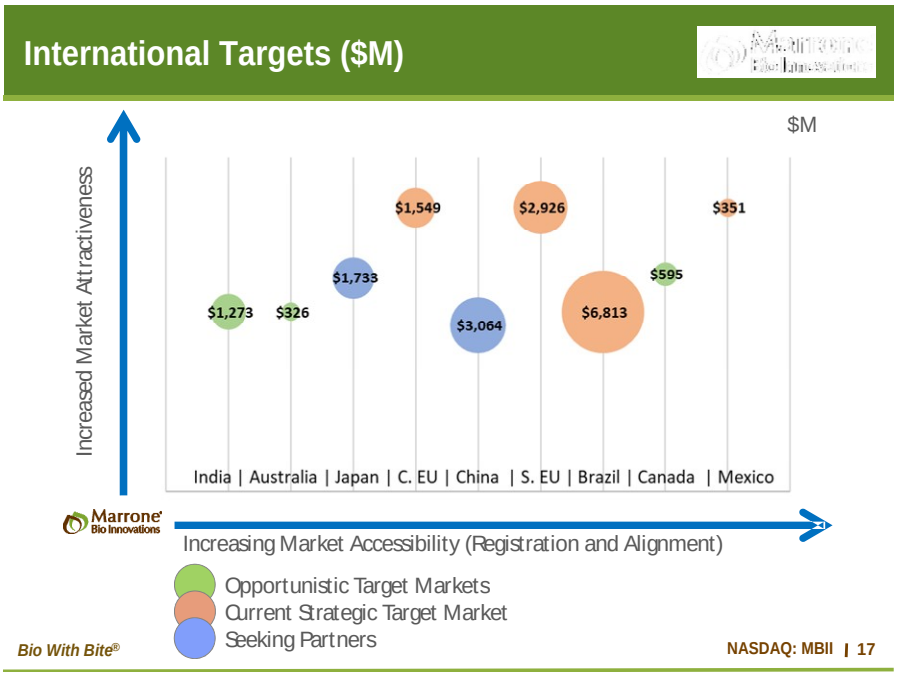

Marrone discussed its current position on cannabis in California on Jan. 18, 2019. The California Dept. of Pesticide, CDP, has confirmed that the use of Grandevo CG is consistent with Food and Agriculture code 12973 in that such use would not conflict with registered labeling for Regalia and Grandevo.

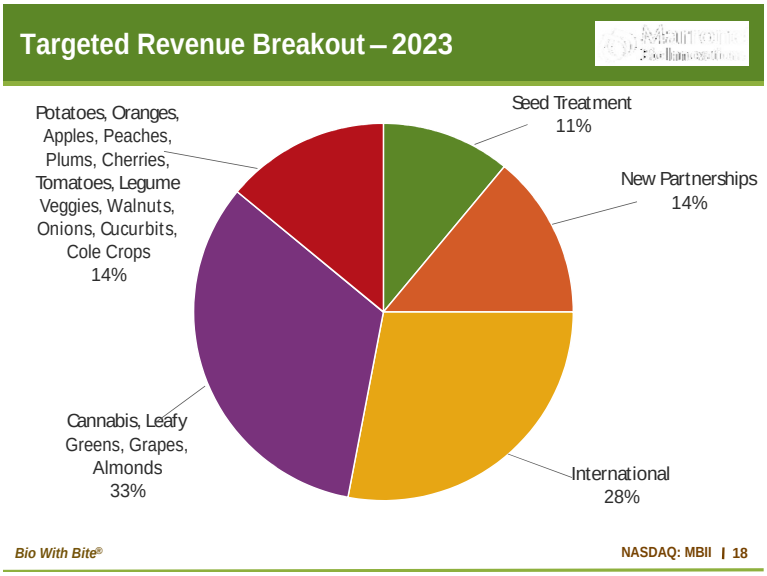

International markets

Marrone is steadily expanding its geographical footprint. Most products have been registered and are on sale in Canada and many in Mexico.

Regalia, Haven and Stargus are on sale in Canada. Venerate and Grandevo, are licensed for sale in Mexico, Majestene and Zequanox are in the registration process.

The largest crop protection market in the world is Brazil, second is the U.S. followed by China, Japan and France. Regalia is registered in Brazil, and Marrone has ongoing programs with field development trials in Brazil, France and China, and trials should start in Japan this year.

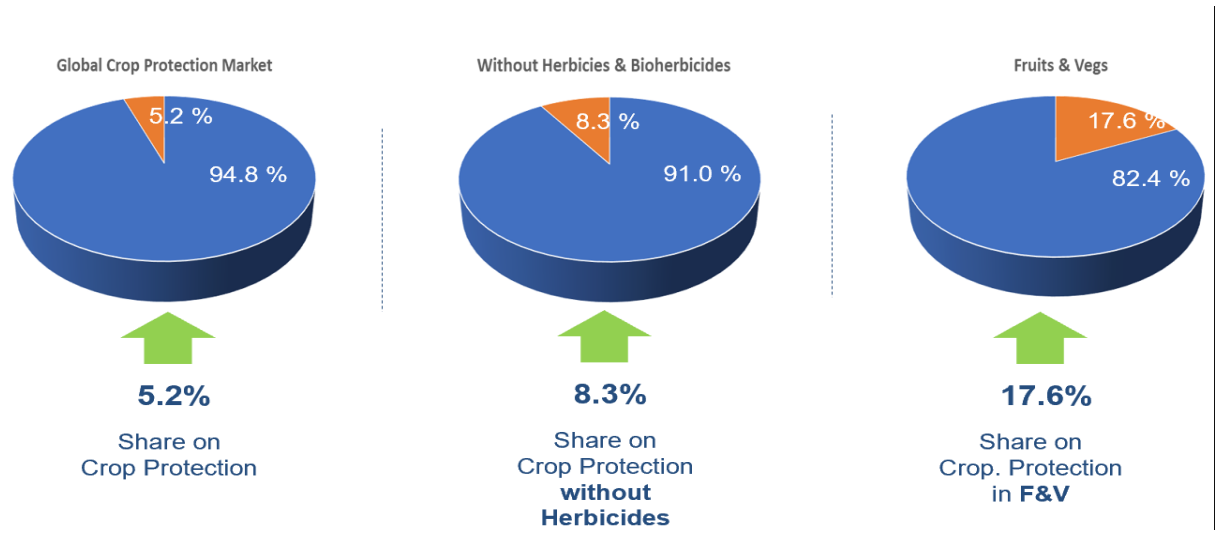

OVERVIEW

Biological pesticides (biopesticides or biocontrol) include several types of pest control that are derived from natural materials such as microorganisms, pheromones to disrupt insect mating, soaps, and some plant extracts. There has been significant work performed on many crops, such as citrus, but the practice extends back over 1,500 years. The first documented report was in about 300 AD involving the control of insects on citrus using ants (source: Wikipedia). In the 1870s predatory mites were shipped from the U.S.A. to France to control a phylloxera that was destroying grape vines.

The overall global crop protection market was about $64 billion in 2017 (DunhamTrimmer, 03/07/2018). The numbers can vary from author to author because the broad definition of crop protection may vary. Excluding herbicides (conventional and bio) the market size is $38 billion and close to a third of this is fruits and vegetables.

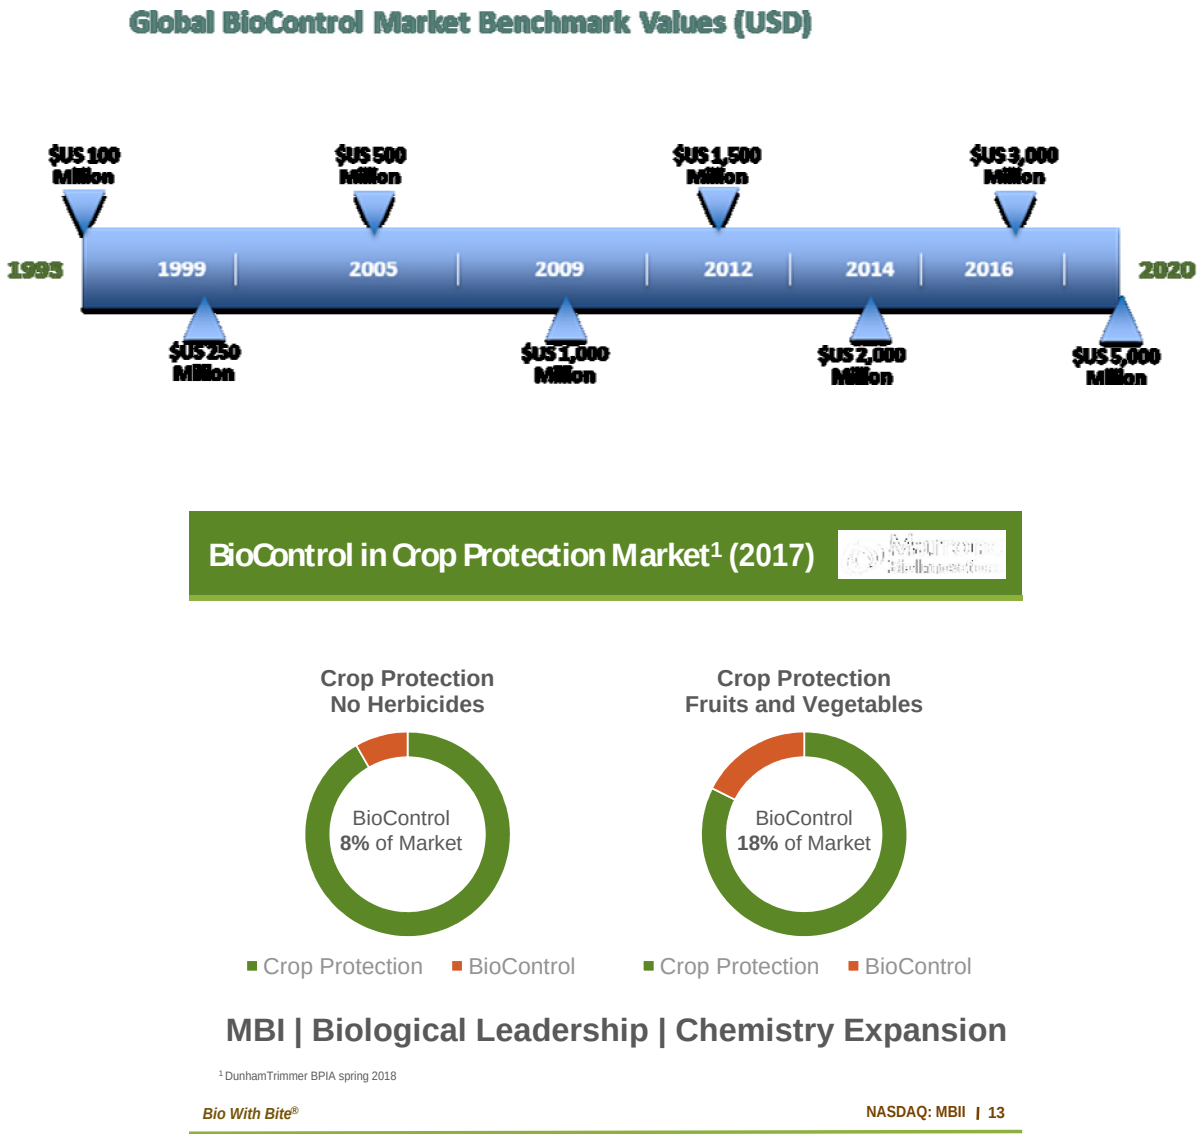

One area of significant interest to Marrone is the fruit, nut and vegetable market.

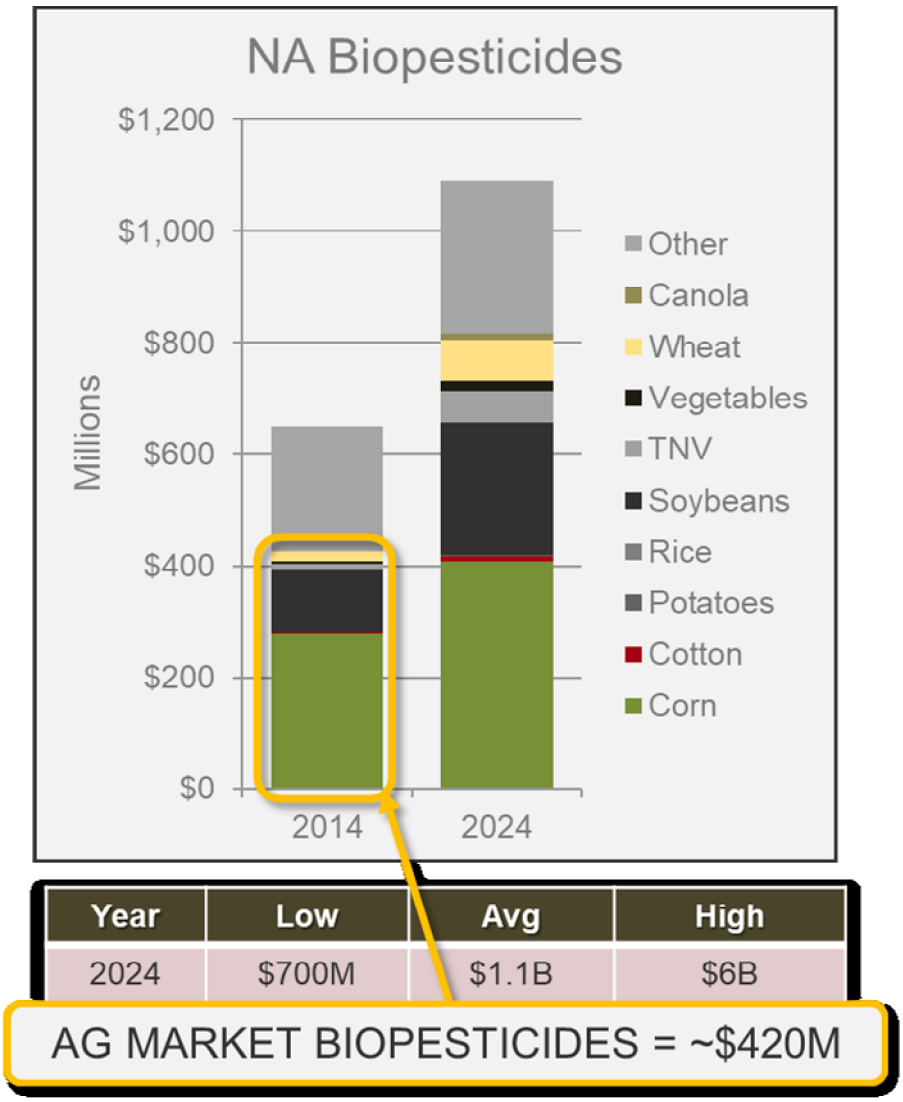

Biocontrol includes abamectin, spinosad, etc

Conventional

The overall pesticide market is estimated to exceed $55 billion (agropages) growing at about 2% a year whereas the biopesticide market is estimated at over $3 billion with a CAGR of between 14% and 18%. Other authors (mordorintelligence.com) estimate that the worldwide market was $2.8 billion in 2017 with South America showing the fastest growth (16.4%) and the United States being the largest market.

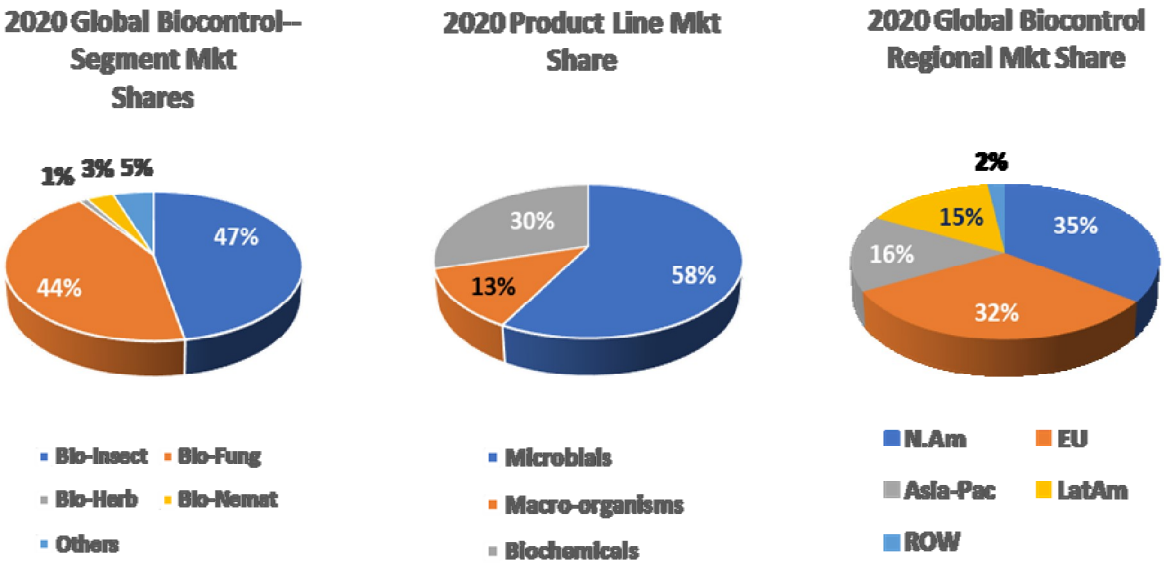

There are many pests that cause significant reductions in revenue generated from a crop. Within the United States the top 10 are shown below: Regional differences depend to a certain extent on climate and are also shown. Year to year changes in the weather can impact certain diseases. For example a dry year in California can reduce certain fungi infections. Regional differences may be due to what infestations impact what crops. For example, corn is a major crop in the US but most of the corn is grown in the north central states with very little grown in the arid western states.

Over 200 biopesticides are currently sold in the United States, significantly more than the 60 in the EU. More than 225 microbial biopesticides are made in 30 countries within the Organization for Economic Cooperation and Development. About 45% of all biopesticide use is in N. America (NAFTA). According to the authors biopesticides account for about 2% of the global plant protection market. The estimated market in 2022 is $8.8 billion based on a CAGR of 17%. This translates to a market size of $2.9 billion in 2015, $3.4 billion in 2016 and $4.7 billion in 2018. The difference between this and other markets may be due to the definition of the global crop protection market.

Mildew. Warm and fuzzy.

Two types of mildew are of significant concern to farmers and horticulturists. They are both white fungi, closely related to moulds but differentiated mainly by color. The two are downy mildew, family Peronosporaceae and powdery mildew (a true fungus), Erysiphales. Both types of mildew are parasites that need a plant host to propagate. They penetrate host cells to feed on nutrients and this weakens the plant, which affects crop yield.

Mildew in general is composed of many types of fungi that are usually specific to a narrow range of hosts. Powdery mildew affect flowering plants and downy mildews are a significant problem for potatoes, grape vines and cucurbits (cucumbers, pumpkins, melons and other gourds).

Mildews thrive under certain climatic conditions of temperature and humidity. Downy mildew (being more closely related to algae) prefer 62% to 93% humidity (moist) and 25 degrees to 31 degrees Centigrade (77 to 88 F) whereas powdery mildew does not need water and thrives in a dry climate. Consequently the period in the year when mildew is best treated varies between the two species.

Corn, for example, is afflicted by eight types of downy mildew, Soybeans by one type of downy and one type of powdery mildew.

The fungus attacks the plant through airborne spores, and produce enzymes that break up plant cells and allow the fungi to penetrate and produce roots in the plant. This blocks photo synthesis and weakens the plant. The fungi can extract nutrients directly from the plant.

Aphids: The vampire pest.

Aphids are insects where the females reproduce by both sexual and asexual (cloning) means. The eggs are missing the Y chromosome and so are all females (XX, and males have only one X). They reproduce rapidly and can become serious threats if not treated quicky. Aphids are sucking insects that cause plants to weaken and reduce yields. There are over 5,000 types of aphids, many are plant specific, some use two plants during their life cycle.

Other sucking insects such as mites, ticks and thrips are significant threats to corn and soybean crops. Hot & dry midyear weather in the Midwest favours mite infestations.

Sucking insects are best treated using systemic insecticides. Bacterial treatments have long been used as biological control. Bacillus thuringiensis, a soil dwelling bacteria, and its sub species are available as dried spores.

Nematodes:

These are wormlike pests that feed on living plants.

Nematodes are microscopic, wormlike creatures which inhabit the soil and damage the roots of plants, impairing their ability to take up water and nutrients. Symptoms of this damage include stunting, yellowing of plant leaves, and loss of plant vitality. They may work themselves into a root. The results may be lesions and galls on the roots

Plant pests (weeds):

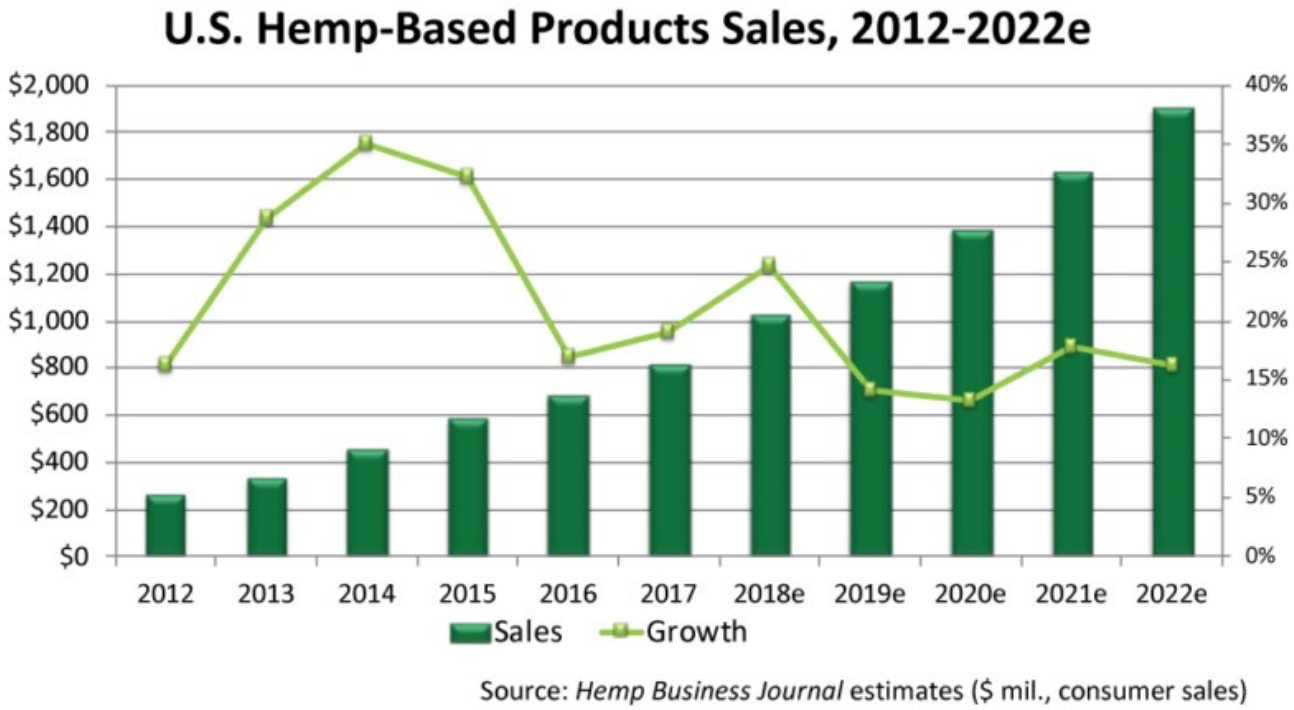

There are many plants that are serious threats in agriculture. These include pigweed (***Amaranths),*** tumbleweed (Russian thistle), nutsedge, lambsquarter, goosefoot. They may not all be treatable with chemical herbicides, but some biological control has been used. Many noxious weeds have developed resistance to such chemical herbicides as glyphosphate (Roundup).

Cannabis:

At the federal level hemp is legal. Marijuana is not. CBD may be. State programs, not yet. The current legal situation is confusing, but Canada is a large potential market.

The cannabis industry has received a great deal of attention over the past few years. It is an important crop and likely to become even more so. It is potentially a major source of revenue to Marrone Bio Innovations. As such we intend to outline the current situation and future prospects as we see them in more detail than we normally would.

It is estimated that 55 million Americans are current recreational users of marijuana. The United States is the second highest user of weed in the world. Canada is in the top 10. Fortune has estimated that the yearly sale of marijuana in the U.S. is currently $8 billion to $10 billion. All uses of hemp, on the other hand, is estimated to be $1 billion in 2018.

On Dec. 20, 2018 the Farm Bill became Law. This legalized industrial hemp, a member of the cannabis family, as defined as "less than 0.3% delta-9 THC (THC is the psychotic drug). At this level the plant is non-intoxicating. Above this level the plant is illegal according to Federal Law. The law also included hemp based products such as CBD when derived from hemp and not from marijuana. [https://www.natlawreview.com/article/2018-farm-bill-legalizes-hemp-obstacles-to-sale-cbd-products-remain; March 05, 2019]

However, many States have passed laws that make the sale of marijuana, a different species of the plant, legal. The psychoactive effects are not apparent until the THC content exceeds 10%. A good quality marijuana bud may contain 35% psychoactive compounds.

[https://www.brookings.edu/blog/fixgov/2018/12/14/the-farm-bill-hemp-and-cbd-explainer/]

Furthermore, under section 10113 of the Farm Bill, to implement a hemp based program state departments of agriculture must consult with the state's governor and chief law enforcement officer to devise a plan that "must be submitted to the Secretary of USDA". Such a plan can ONLY commence when the plan is approved by the USDA. No plan-No hemp.

As a result all current state plans are illegal until such a plan has been submitted and approved.

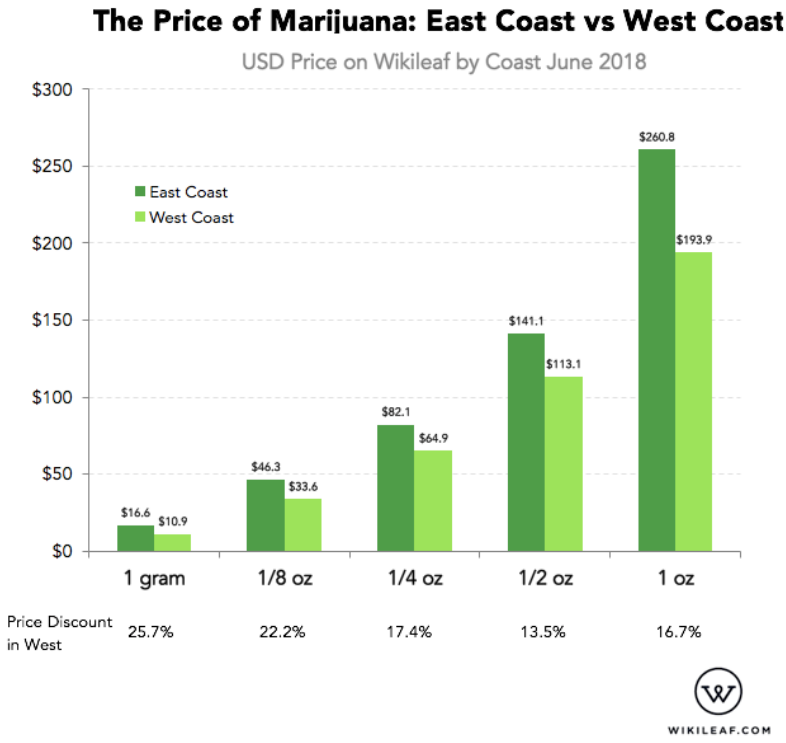

A cannabis plant may be legal at the State level but illegal at the Federal level. This means that marijuana or products derived from cannabis cannot be transported across state lines. This includes CBD. All cannabis plants and products may be illegal.

Then there is the FDA! In a statement made by the FDA Commissioner on Dec. 20, 2018 it was stated that "it is unlawful under the FD&C Act to introduce food containing added CBD or THC into interstate commerce, or to market CBD or THC products as, or in, dietary supplements". Currently CBD is not authorized to be a dietary supplement or to be used in food. In other words, CBD is illegal no matter what plant it comes from if it is used as a medicine or food supplement CBD remains a Schedule I substance under federal law.

Assuming that recreational marijuana is legalized under federal law the question becomes one of supply. There is currently, albeit illegal, transportation of marijuana through and from Mexico into the United States. This is unlikely to stop if marijuana is legalized at the federal level. Although the current product is mainly low quality and marijuana is illegal in Mexico, the potential of production in Latin Americas for the American market still exists. The current growth in the United States may be due solely to the transfer from an illegal market to a state legal one and not to any growth in overall marijuana consumption.

The legal sale of cannabis is heavily taxed. This is, or may become, a major source of income to the states. It is to the states benefit to file plans asap and become legal. The problem with CBD is more complex and it may not be possible to have CBD declared GRAS.

On March 14, 2019 Terra Tech (OTCQX: TRTC) stated that the revenue shortfall in 4Q 2018 was due to the significant level of taxes the State of California placed on Cannabis, which depressed the legal market.

The Price of Marijuana: East Coast vs West Coast Cities

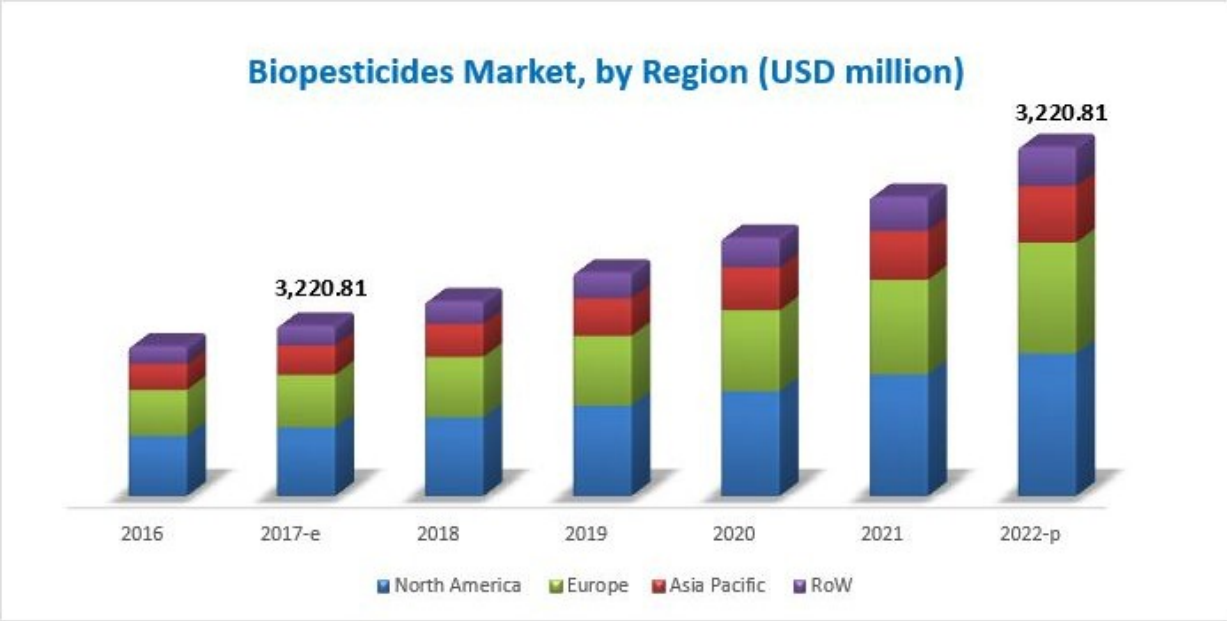

USD Price of 1/8 of an ounce on Wikileaf June 2018

Rank	City Name	State Name	$ Price
1	Baltimore, MD	East	$53.7
2	Boston, MA	East	$48.3
3	San Francisco, CA	West	$43.6
4	Seattle, WA	West	$37.9
5	Portland, ME	East	$37.0
6	Los Angeles, CA	West	$35.7
7	Denver, CO	West	$32.1
8	Portland, OR	West	$30.6

WIKILEAF.COM

In March 2019 an ounce of Acapulco Gold cost about $320 in NYC. That's over $10,000 a kilo. A "square grouper" may weigh over 30 Kg. No wonder cannabis stocks are popular. But, it is still illegal for recreational marijuana to cross state lines. Fortunately Marrone Bio Innovations should benefit no matter whether hemp is the only crop and is well prepared for greenhouse cultivation.

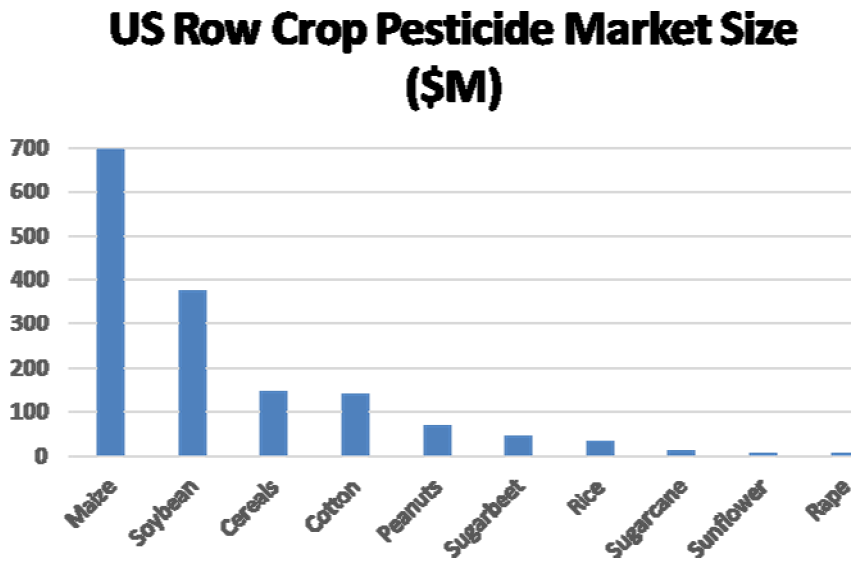

INDUSTRY OUTLOOK

One driver of alternatives to chemical pesticides is the demand for organic foods and, therefore, chemical fertilizer (NPK) and organic farming without chemical pesticides

Pesticide treatment is based on acres treated. The market opportunity to companies like Marrone Bio Innovations depends on which pest needs to be treated at a reasonable cost and how many acres can be treated at the time of infestation.

Corn is the US name for maize

INDUSTRY POSITION

Over the years a significant industry has emerged with estimated revenue of over $4.7 billion in 2018 growing at close to 17% a year. It is estimated that there are over 400 companies involved, with 98% of them being privately owned (Dunham Trimmer).

Based on estimated sales of those companies owned by the large ag chemical companies, Marrone Bio Innovations has been ranked in the lower half of the top ten companies.

VALUATION

There are no public companies like Marrone Bio Innovations. The characteristics of MBII are more like a pharmaceutical company than an agricultural or food additive company. The comparison list is companies with some agricultural operations

COMPARISON TABLE	Ticker	Price	Mkt	P/B	P/S	EV/Sales	Shares out	Inst.	Insider
(Source: Yahoo Finance)		5/3/20	Cap	LQ	L4Q	L4Q	million	Ownership %	Ownership %
			(in million)						
Marrone Bio Innovations.	**MBII**	**$0.71**	**$103.3**	**4.39**	**2.82**	**2.54**	**145.5**	**71.7**	**0.8**

Median				2.30	2.82	4.10			

RISKS

Near term profitability is unlikely, and Marrone Bio Innovations may need another funding before the end of 2021.

There is uncertainty about the company's ability to continue as a going concern

Sales growth is essential to survival.

Marrone Bio Innovations ahs limited experience in marketing and selling and will need to expand sales and marketing infrastructure.

Customer concentration. 63% of 3Q18 revenue went to three customers, and 64% of accounts receivable were from the same three customers. For the full year 2018 52% of the total revenue was to the top two distributors.Loss of one of these customers would have a significant impact on MBII.

All products require registration which could be withdrawn if the products are considered to be unsafe to the environment, to the public or cause harm when used in conjunction with chemical pesticides.

Gene editing technology is becoming a significant factor in pest control. This may impact conventional pesticide treatments.

INSIDER TRADING AND OWNERSHIP

DISCLOSURES

The following disclosures relate to relationships between Zacks Small-Cap Research ("Zacks SCR"), a division of Zacks Investment Research ("ZIR"), and the issuers covered by the Zacks SCR Analysts in the Small-Cap Universe.

ANALYST DISCLOSURES

I, Ian Gilson, hereby certify that the view expressed in this research report accurately reflect my personal views about the subject securities and issuers. I also certify that no part of my compensation was, is, or will be, directly or indirectly, related to the recommendations or views expressed in this research report. I believe the information used for the creation of this report has been obtained from sources I considered to be reliable, but I can neither guarantee nor represent the completeness or accuracy of the information herewith. Such information and the opinions expressed are subject to change without notice.

INVESTMENT BANKING AND FEES FOR SERVICES

Zacks SCR does not provide investment banking services nor has it received compensation for investment banking services from the issuers of the securities covered in this report or article.
Zacks SCR has received compensation from the issuer directly, from an investment manager, or from an investor relations consulting firm engaged by the issuer for providing non-investment banking services to this issuer and expects to receive additional compensation for such non-investment banking services provided to this issuer. The non-investment banking services provided to the issuer includes the preparation of this report, investor relations services, investment software, financial database analysis, organization of non-deal road shows, and attendance fees for conferences sponsored or co-sponsored by Zacks SCR. The fees for these services vary on a per-client basis and are subject to the number and types of services contracted. Fees typically range between ten thousand and fifty thousand dollars per annum. Details of fees paid by this issuer are available upon request.

POLICY DISCLOSURES

This report provides an objective valuation of the issuer today and expected valuations of the issuer at various future dates based on applying standard investment valuation methodologies to the revenue and EPS forecasts made by the SCR Analyst of the issuer's business.
SCR Analysts are restricted from holding or trading securities in the issuers that they cover. ZIR and Zacks SCR do not make a market in any security followed by SCR nor do they act as dealers in these securities. Each Zacks SCR Analyst has full discretion over the valuation of the issuer included in this report based on his or her own due diligence. SCR Analysts are paid based on the number of companies they cover. SCR Analyst compensation is not, was not, nor will be, directly or indirectly, related to the specific valuations or views expressed in any report or article.

ADDITIONAL INFORMATION

Additional information is available upon request. Zacks SCR reports and articles are based on data obtained from sources that it believes to be reliable, but are not guaranteed to be accurate nor do they purport to be complete. Because of individual financial or investment objectives and/or financial circumstances, this report or article should not be construed as advice designed to meet the particular investment needs of any investor. Investing involves risk. Any opinions expressed by Zacks SCR Analysts are subject to change without notice. Reports or articles or tweets are not to be construed as an offer or solicitation of an offer to buy or sell the securities herein mentioned.

CANADIAN COVERAGE

This research report is a product of Zacks SCR and prepared by a research analyst who is employed by or is a consultant to Zacks SCR. The research analyst preparing the research report is resident outside of Canada, and is not an associated person of any Canadian registered adviser and/or dealer. Therefore, the analyst is not subject to supervision by a Canadian registered adviser and/or dealer, and is not required to satisfy the regulatory licensing requirements of any Canadian provincial securities regulators, the Investment Industry Regulatory Organization of Canada and is not required to otherwise comply with Canadian rules or regulations.
